

# Joint Agency Modelling:

A process to deliver emergency response national guidance for a radiological atmospheric release

## **Sarah Millington, Met Office**

Mathew Richardson, Met Office

Lois Huggett, Met Office

Lorenzo Milazzo, Met Office

Keith Mortimer, Public Health England

Carol Attwood, Environment Agency

Chris Thomas, Food Standards Agency

Dayle Edwards, Office for Nuclear Regulation

Darren Cummings, Office for Nuclear Regulation

# Purpose of JAM

- Radioactive material in the atmosphere can affect human health via:

- Inhalation
- External dose from deposited material
- Ingestion of contaminated food & water
- + other pathways

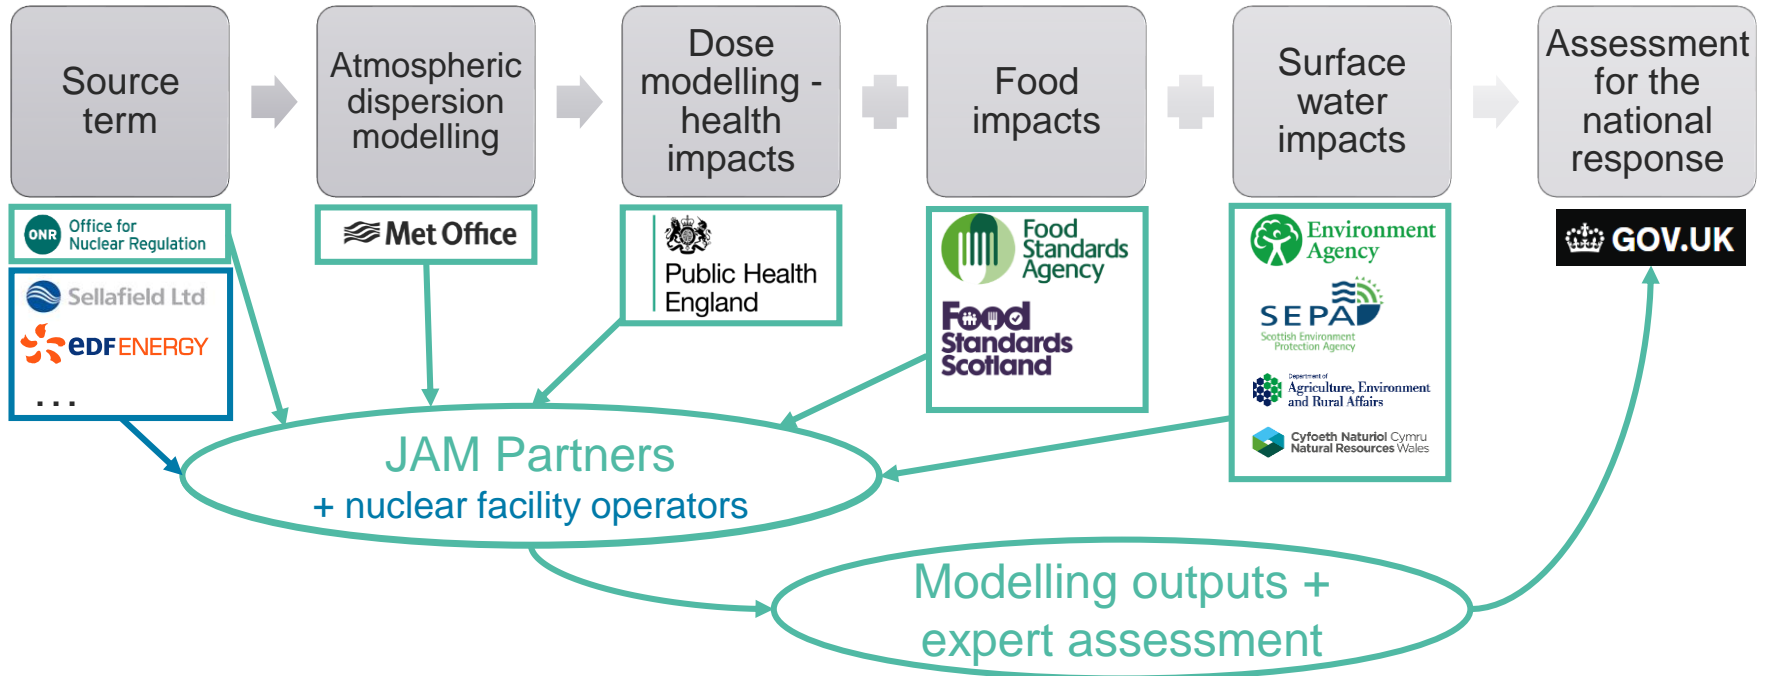

*Keith Mortimer, Public Health England*

- JAM provides:

- **Assessments** of the impacts and potential areas for protective actions
- based on **scenarios** of what's been released
- to **central UK Government** to aid strategic decision-making during an emergency
- by **modelling** AND reaching a **consensus** on the key points and uncertainties

# The process and the partners

All modelling is run at the Met Office (other agencies will do additional modelling)

# Source terms

- Sent by the Operator or ONR
- Information on:
  - Location
  - Radionuclides
  - Quantity
  - Time-varying
- Scenarios:
  - Already occurred
  - Most likely
  - Reasonable worst case

## Part 3 - Estimate of the release that's already occurred (i.e. past only)

...

## Part 4 - Estimate of the future most likely release (i.e. future only)

Part 4 - Estimate of the future most likely release (i.e. future only)							
Part 4: column start date (dd/mm/yyyy)						20/03/2019	
Part 4: column start time (hh:mm Local Time)						11:00	
Part 4: column end date (dd/mm/yyyy)						20/03/2019	
Part 4: column end time (hh:mm Local Time)						14:00	
Height of release: e.g. stack or building height (m agl)						0	
<i>Optional: Estimated height of the top of the plume (if visible) above the release point (m agl)</i>							
Nature of release: i.e. leak; fire; explosion						Fire	
	Chemical symbol e.g. Cs-137	<i>Optional: Gas or Particulate (g/p)</i> <i>(leave blank if unknown)</i>	<i>Optional: Depositing? (y/n)</i> <i>(leave blank if unknown)</i>	Activity * (Bq)	Activity * (Bq)	Activity * (Bq)	
Radionuclide 1	I-131			4.1E+16			
Radionuclide 2	Cs-137			5.5E+15			
Radionuclide 3							
Radionuclide 4							
Radionuclide 5							

## Part 5 - Estimate of the future release if mechanisms to control the release fail (i.e. future only)

SAGE

# Atmospheric dispersion modelling

- NAME (Numerical Atmospheric-dispersion Modelling Environment)  
<https://www.metoffice.gov.uk/research/modelling-systems/dispersion-model>
- Developed by Met Office, UK
- Lagrangian off-line dispersion model
- Represents advection, diffusion, chemical transformations, deposition, gravitational settling, radioactive decay, plume rise, resuspension,...
- Many uses, e.g. chemical, biological, volcanic ash, dust, air quality, disease spread, and radioactive releases.

NAME is available for external research use under licence

Dose Modelling

Food & water

SAGE

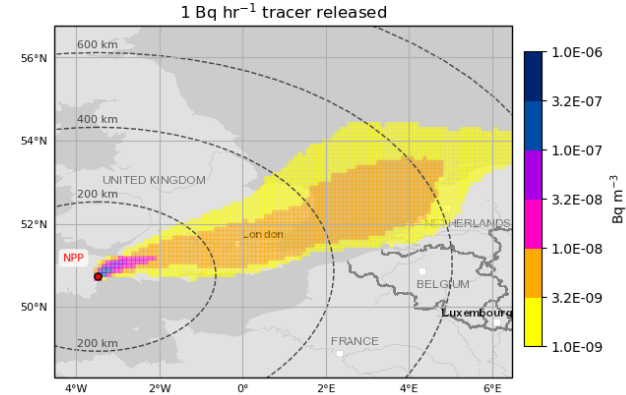

# Atmospheric dispersion modelling

- Inputs:
  - Source term from a UK operator or ONR
  - Meteorological data:
    - Global data at 10 km
    - UK data at 1.5 km
    - ECMWF data
- Outputs:
  - Time-average and integrated air concentration
  - Wet, dry & total deposition

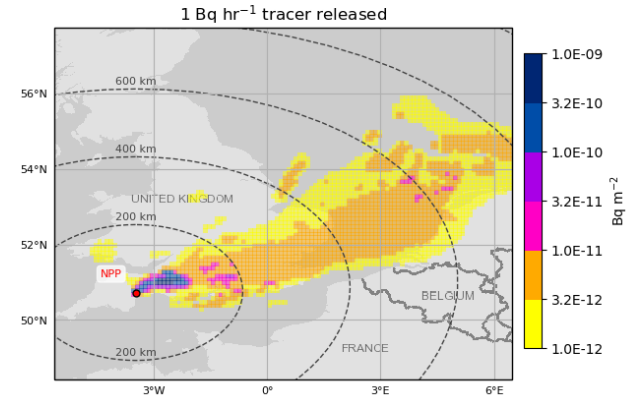

} Horizontal spatial resolution (approx.)

} For each radionuclide (in source term + daughters)

Total integrated tracer air concentration over 48 hours between 20/03/2019 09:00 and 20/03/2019 14:00

Total integrated tracer deposition over 48 hours between 20/03/2019 09:00 and 20/03/2019 14:00

Dose Modelling

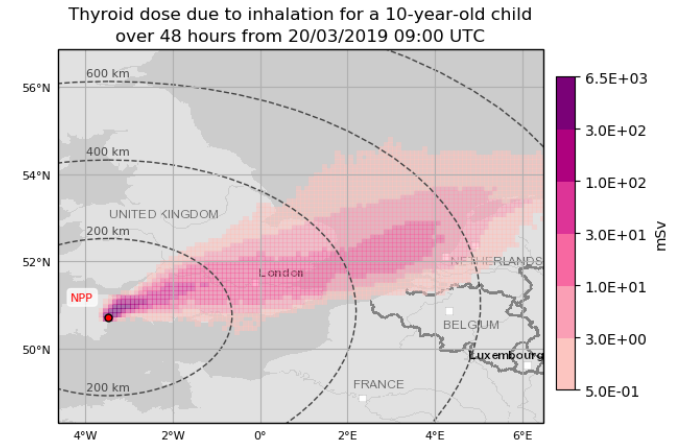

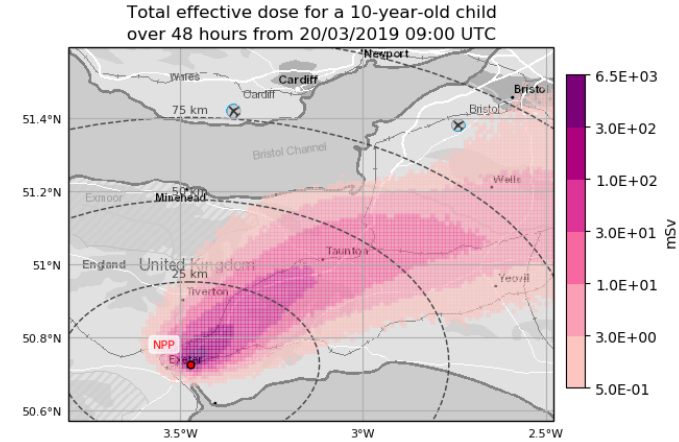

Food & water

SAGE

# Dose modelling

- Public Health England supply code and data
- Time-integrated air concentrations and deposition  
→ indicative dose quantities:
  - Total effective dose  
(committed effective dose + external effective dose)
  - Thyroid dose (inhalation)
- Dose is calculated for an infant, 10-year old or adult

ADM

Dose Modelling

Food & water

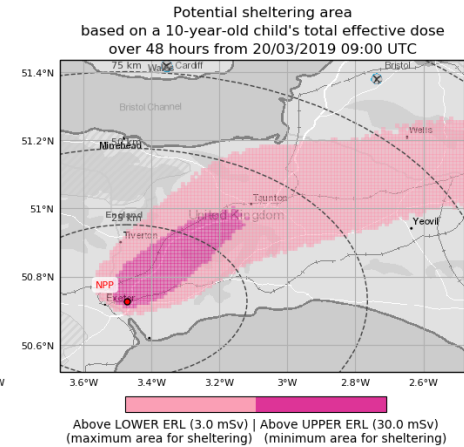

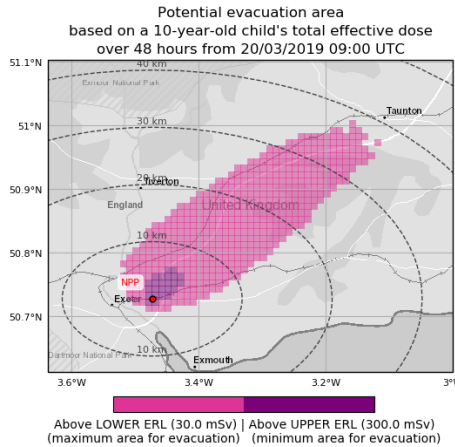

SAGE

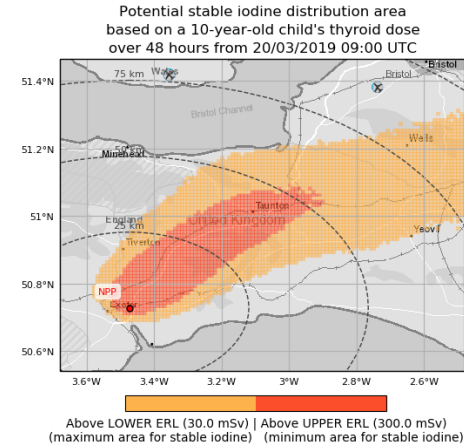

# Dose modelling

- Dose calculations → potential areas for protective actions to reduce early health impacts
- Emergency Reference Levels (ERL) are used as thresholds

Protective action	Averted dose (mSv)	
	Lower ERL	Upper ERL
Evacuation	30	300
Sheltering	3	30
Stable iodine	30	300

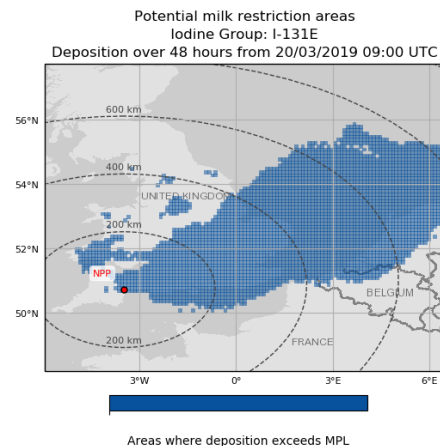

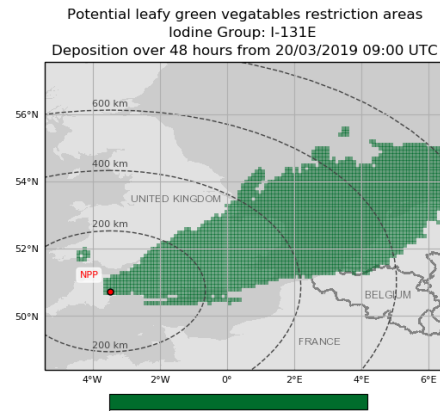

Note: Other factors are considered in decision making and thus actions taken.

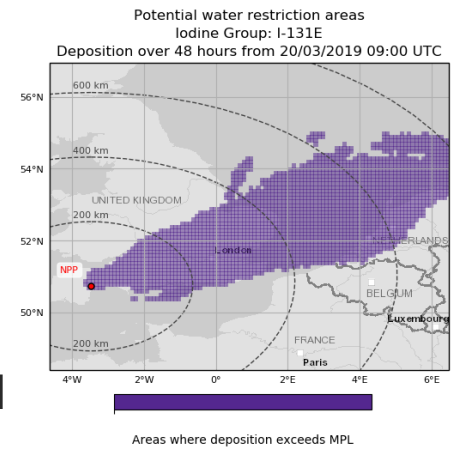

# Food impact modelling

- Maximum Permitted Level (MPL) for each radionuclide permitted in foodstuffs (European Council Regulation)
- Food Standards Agency model the transport of radionuclides in food chains → deposited activity level equating to the MPL (→ static threshold table)
- Sum deposited activity in 4 groups:
  - Strontium isotopes
  - Iodine isotopes
  - Alpha-emitting isotopes of plutonium and trans-plutonium
  - All other radionuclides (half-life > 10 days)

# Surface water modelling

- Similar methodology as for food impacts
- Environment Agency calculates the activity per litre permitted in surface water supplies → static threshold table
- For each radionuclide group: compare deposition with thresholds to highlight areas when deposited activity is too high for surface water supplies
- Select the radionuclide group with the largest impact area

SAGE

# Scientific Advisory Group for Emergencies (SAGE)

- JAM SAGE Brief → SAGE attendees (Government Chief Scientists, high-level reps from government agencies, industry and academia)
- JAM assessment considered alongside other information
- SAGE provides scientific advice to national government during an emergency (e.g. Government Chief Scientific Advisor → Prime Minister)

Classification: OFFICIAL	Joint Agency Modelling (JAM) - SAGE Brief Model run at 16:59 on 17/05/2019	Mode: TEST
<b>Assessment for the most likely release (ongoing)</b>		
<b>JAM inputs</b>		
Incident at:	<b>NPP</b>	
Location (WGS84 datum):	50.73 N, 3.47 W	
OS Grid Reference:	SX961930	
Status of release:	Ongoing	
Release Start:	Wednesday 20/03/2019 09:00 UTC	
Release Duration:	5.0 hours	
Time span modelled:	0 - 48 hours	
<b>Impacts modelled based on atmospheric dispersion only - potential areas for countermeasures</b>		
<small>(Note: no account is taken of the location of populations, food production areas or lakes and rivers)</small>		
Early health:	Potential evacuation, sheltering & stable iodine areas	
Food:	Potential milk & leafy green vegetable restriction areas	
Water:	Areas where radioactivity in surface water could exceed the Maximum Permissible Levels for drinking water	
<b>Definition of the most likely release (ongoing)</b>		
<small>Modelling based on the current best estimate of the source term for the most likely release.</small>		
<small>The source term was provided by Met Office via a JAM Proforma completed on 20/03/2019 at 11:00 Local Time.</small>		
Run ID: JAM_MFP_1905171659	Please send JAM requests via SAGE JAM contact: JAM@phe.gov.uk	Page 1 of 10

# A cyclical process

# Joint Agency Modelling (JAM) – a summary

- Born out of the response to the Fukushima Daiichi accident
- A multi-agency response to provide assessments to UK Government on the potential impacts and protective actions following a radiological release anywhere in the world
- Includes scenarios and uncertainties
- Developed over many years and ready to be operational
- Successfully tested during a recent national exercise

Thank you for your attention
