Laboratory of Atmospheric Chemistry (LAC)
Paul Scherrer Institute, Switzerland
<http://lac.web.psi.ch>

HARMO13, Paris, 1-4 June 2010

Goal

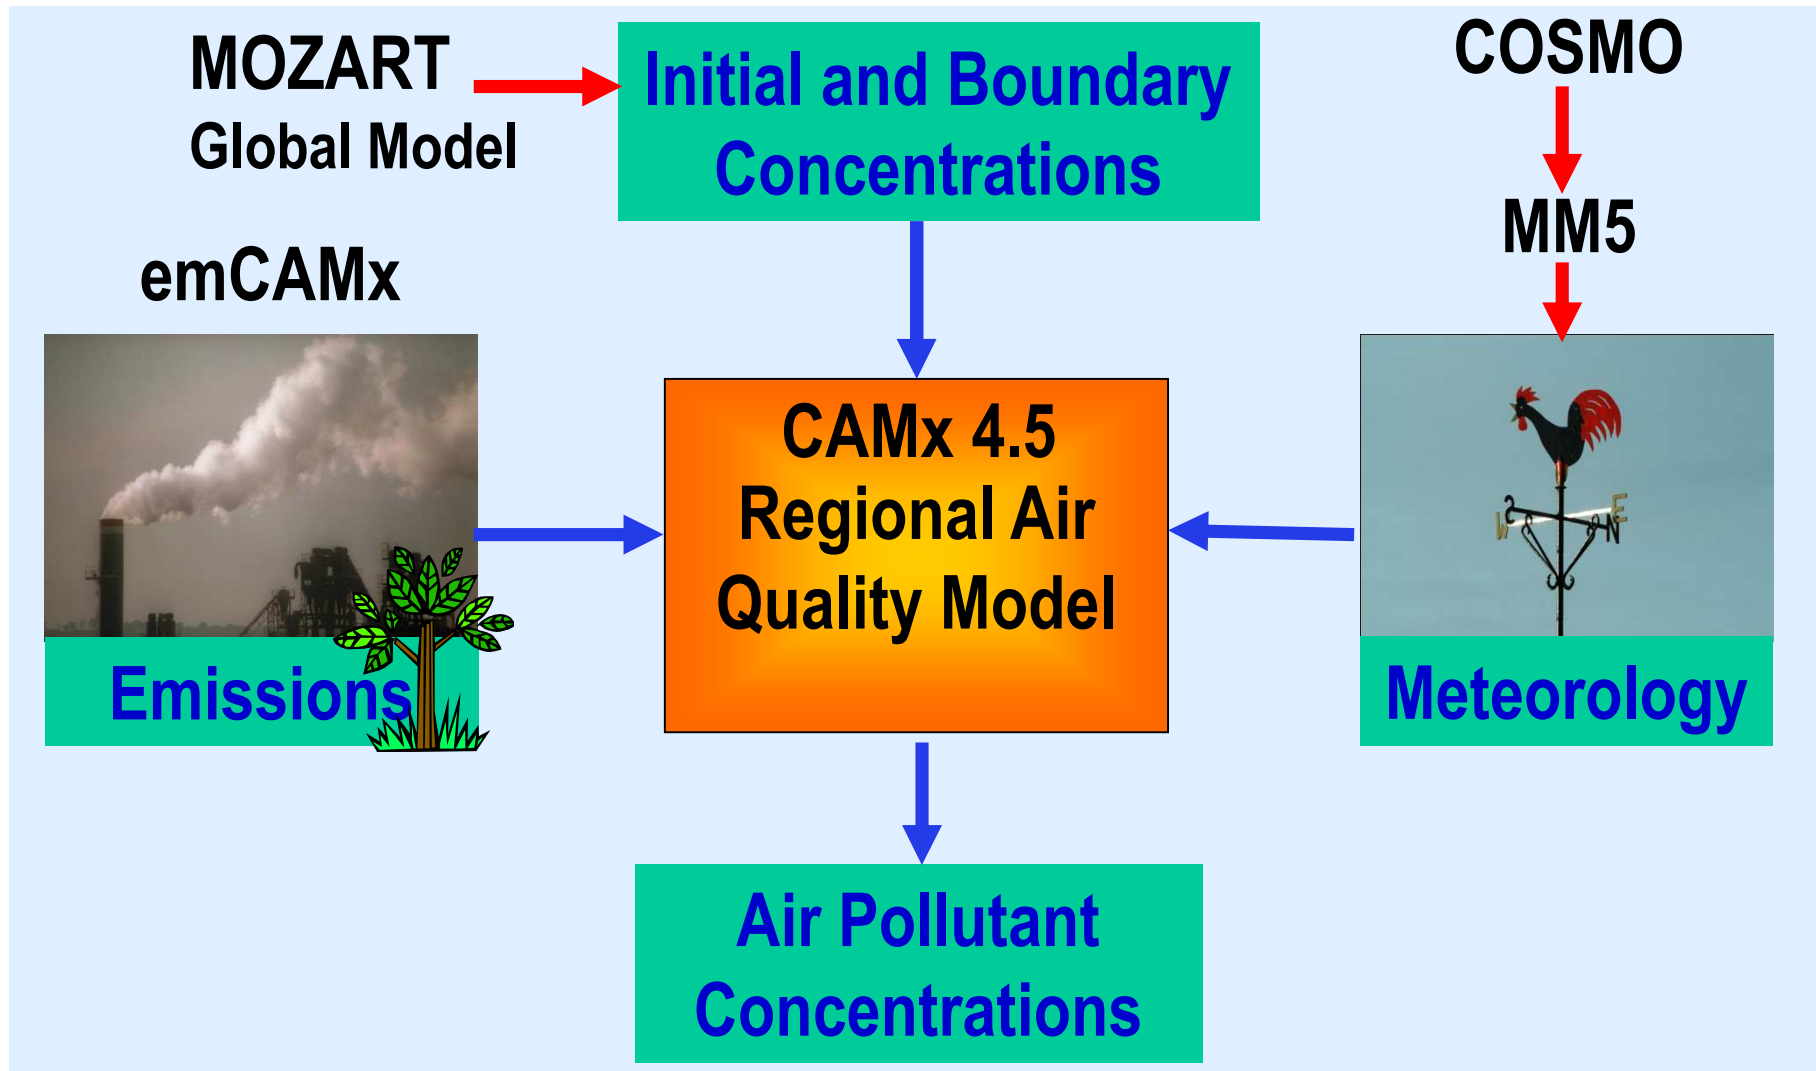

Ozone (June 2006):

- sensitivity to anthropogenic precursor (NO_x and VOC) emissions and comparison with 1993
- sensitivity to isoprene emissions

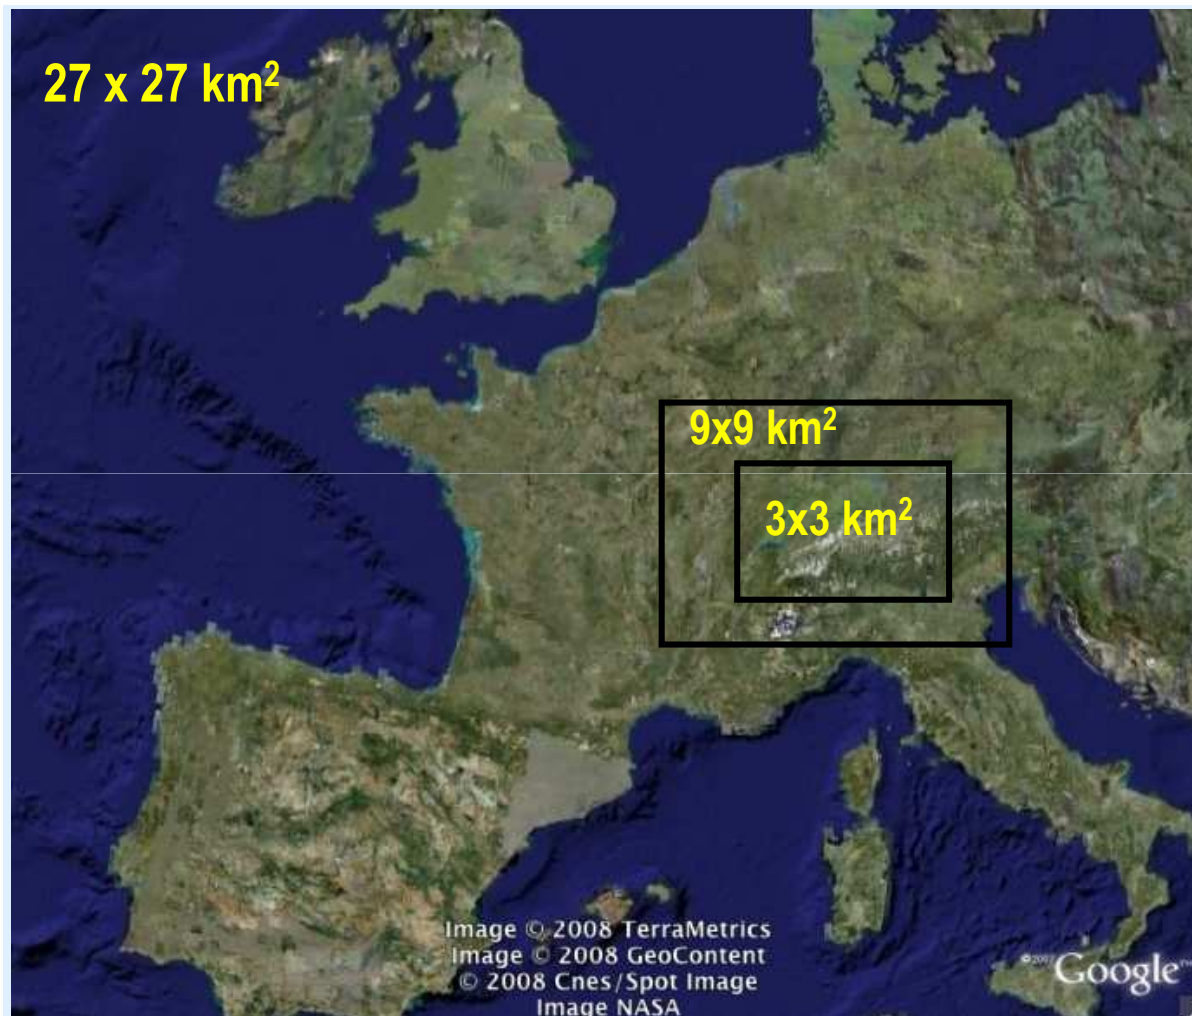

Aerosols (January, June 2006):

- Inorganic Aerosols: sensitivity to NO_x and NH_3 emissions
- Organic Aerosols: contribution of primary organic aerosol (POA) emissions
contribution of biogenic VOC (BVOC) emissions to
secondary organic aerosol (SOA)

Components of the Air Quality Model

Modelling Method

- 31 layers in MM5
- 14 layers in CAMx

- 1-31 January 2006
- 1-30 June 2006

- CB05 gas -phase mechanism

- PM2.5

- 7 SOA classes

- oligomerization

Sensitivity tests

Ozone

<i>NO_x emissions (%)</i>	100, 90, 70, 50
<i>VOC emissions (%)</i>	100, 90, 70, 50
<i>Isoprene emissions (factor)</i>	1, 20

Aerosols

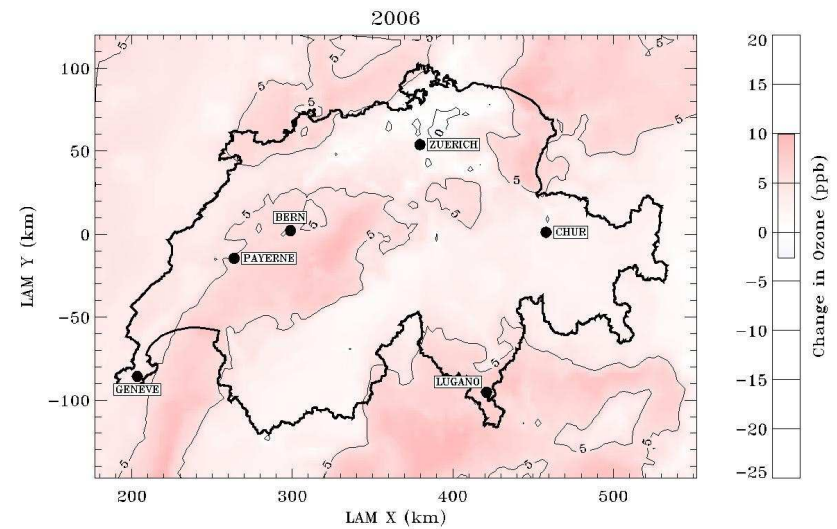

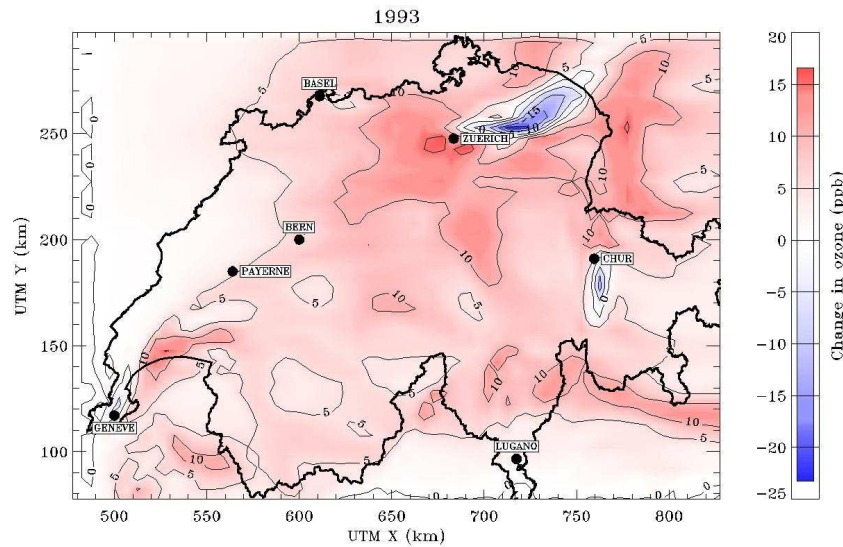

<i>NO_x emissions (%)</i>	100, 50
<i>NH₃ emissions (%)</i>	100, 50

Ozone : Sensitivity to Precursor Emissions

Base Case - 50% NO_x

1993

2006

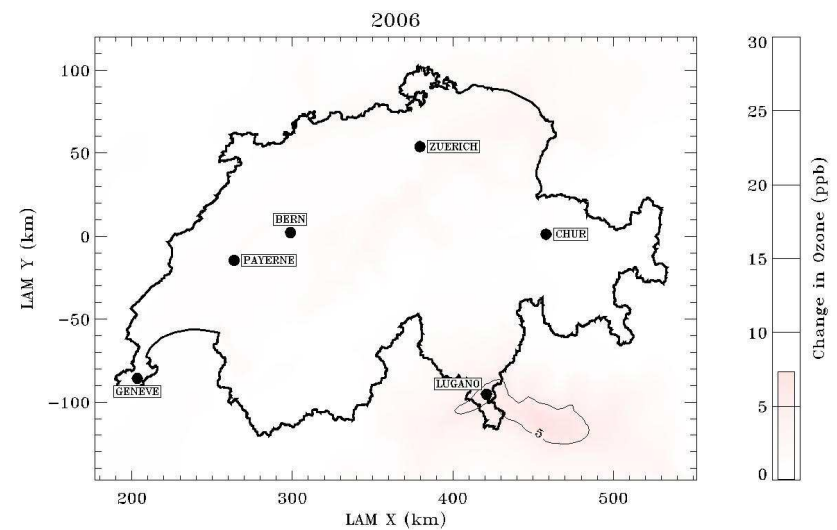

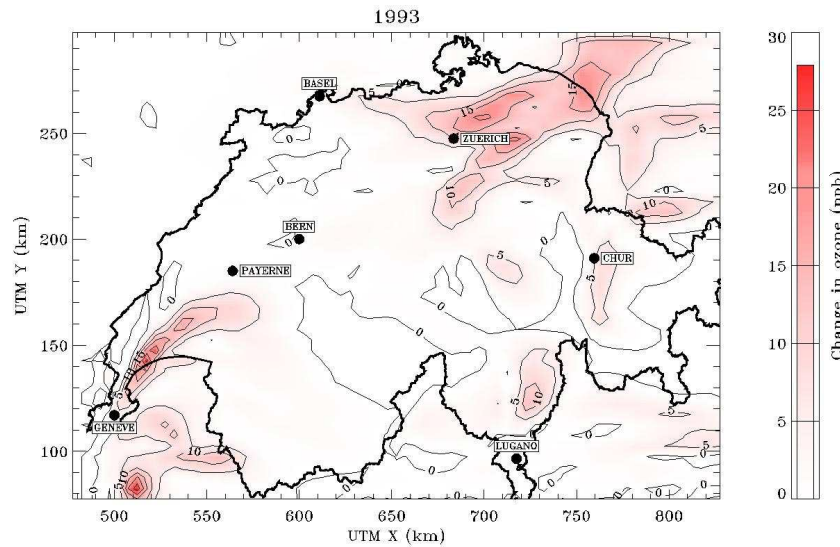

blue : increase in peak ozone
red : decrease in peak ozone

Ozone : Sensitivity to Precursor Emissions

Base Case - 50% VOC

1993

2006

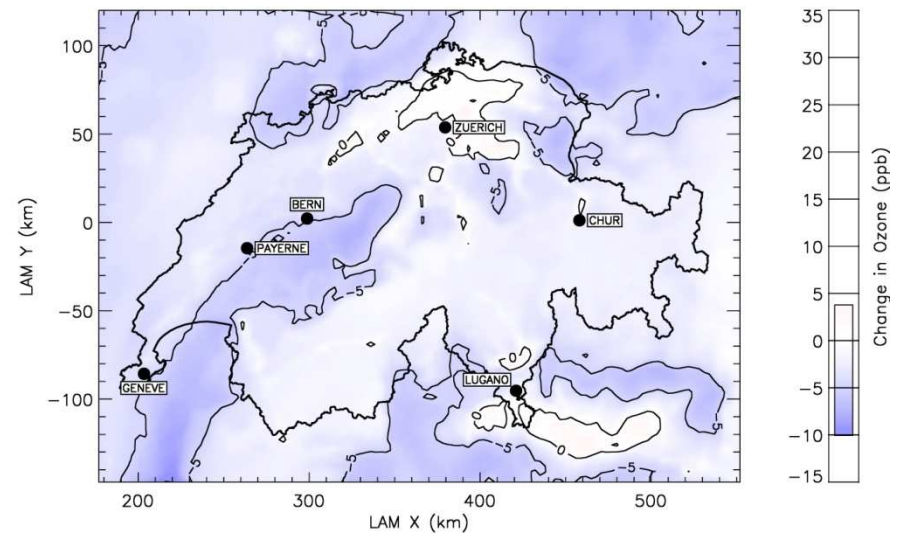

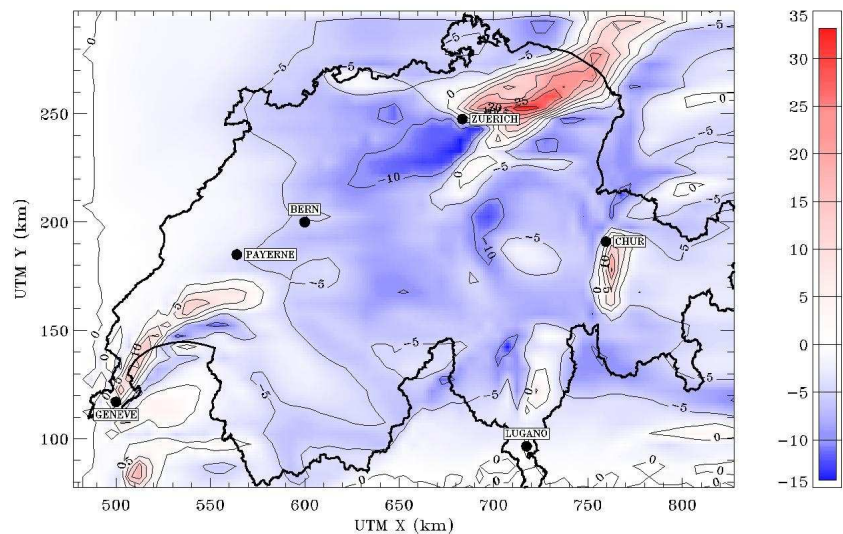

blue : increase in peak ozone
red : decrease in peak ozone

Ozone : Sensitivity to Precursor Emissions

O_3 (50% NO_x) - O_3 (50% VOC)

1993

2006

blue : NO_x -sensitive red : VOC-sensitive

Ozone : Sensitivity to Isoprene Emissions

Zurich, north

Lugano, south

Ozone : Sensitivity to Isoprene Emissions

Zurich, north

Lugano, south

Aerosols: Relative contributions (winter 2006, Zurich)

Measurements

Model predictions

Organic aerosols and **particulate nitrate** are the main components

Aerosols: Relative contributions (summer 2006, Payerne)

Measurements

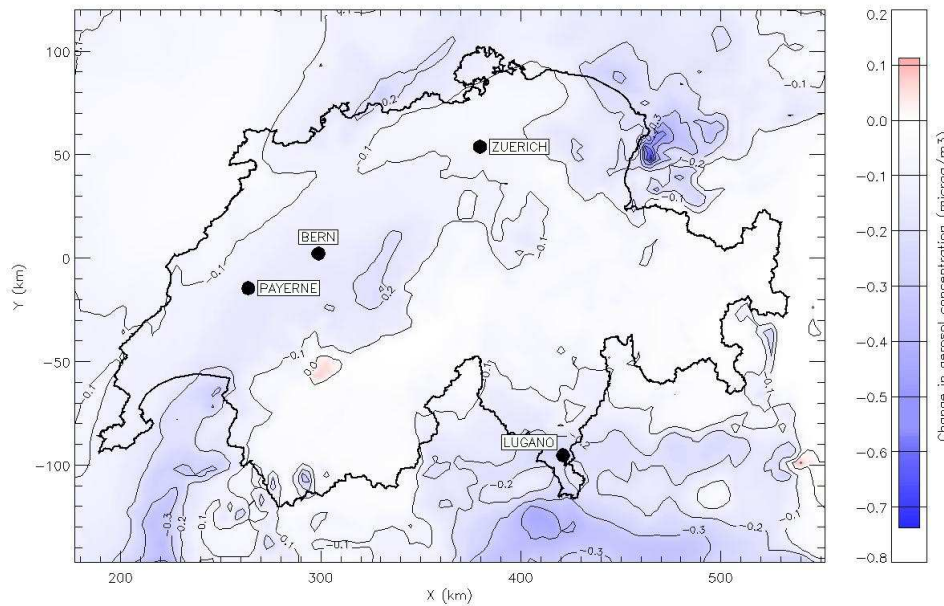

Model predictions

Organic aerosols are the main components

Inorganic Aerosols : Sensitivity to NO_x , NH_3 emissions

aerosol mass (50% NO_x) - aerosol mass (50% NH_3)

15 June 2006, afternoon

Blue : NO_x -sensitive
Red : NH_3 -sensitive

*enough ammonia is available,
formation of inorganic aerosols is limited by NO_x emissions*

Organic Aerosols : Mechanism in CAMx 4.5

Primary Organic Aerosol (POA)

emitted

Secondary Organic Aerosol (SOA)

formed from precursors:

anthropogenic

: toluene, xylene (AROM)

biogenic

: isoprene (ISP)

biogenic

: monoterpenes (TRP)

biogenic

: sesquiterpenes (SQT)

anthropogenic SOA

formed from oligomerization of:

: AROM (SOPA)

biogenic SOA

: ISP, TRP (SOPB)

Organic Aerosols : Contribution of POA emissions

January 2006, Zurich

Model (%)
Obs. (%)

POA	56	45
SOA	44	55

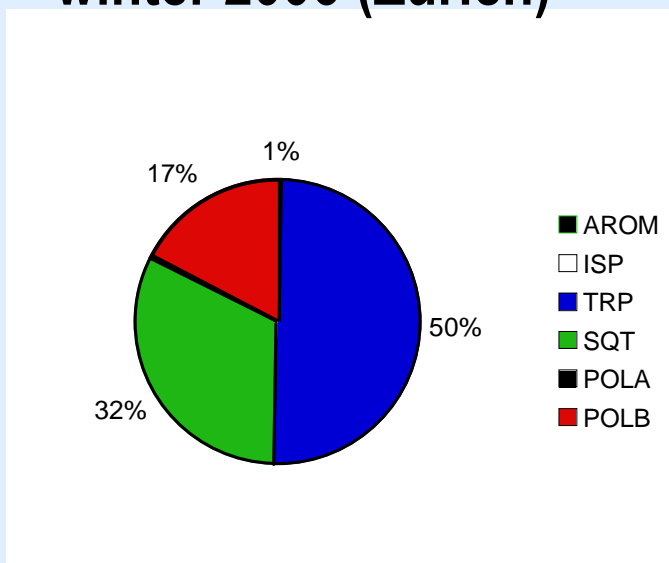

June 2006, Payerne

POA	31	6
SOA	69	94

Organic Aerosols : Contribution of BVOC emissions to SOA

winter 2006 (Zurich)

summer 2006 (Payerne)

AROM : SOA from toluene and xylene

ISP : SOA from isoprene

TRP : SOA from monoterpenes

SQT : SOA from sesquiterpenes

POLB : oligomerized SOA from biogenic species (ISP, TRP)

POLA : oligomerized SOA from anthropogenic species (AROM)

Conclusions

- The sensitivity of ozone formation in Switzerland has changed towards more NO_x -limited regime since 1993.
- Isoprene is more effective for ozone in southern Switzerland.
- Model results suggest that there is enough ammonia in the domain and inorganic aerosol formation is mainly limited by HNO_3 (NO_x emissions).
- SOA is produced dominantly from biogenic precursors such as monoterpenes and sesquiterpenes as well as oligomerization of particles. SOA formed from isoprene oxidation is negligible in Switzerland.
- Currently modelled SOA concentrations are lower than those derived from measurements. Using volatility approach might improve it.
