

Wind-tunnel measurements of accidental gas releases in a simplified urban environment

Eva Berbekar, Dr. Frank Harms, Prof. Dr. Bernd Leitl

Environmental Wind Tunnel Laboratory,
Meteorological Institute,
University of Hamburg

Department of Fluid Mechanics,
Budapest University of Technology and
Economics

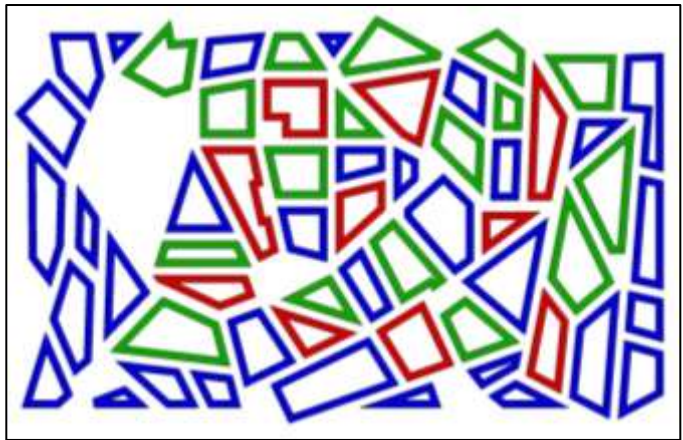

COST Action ES 1006: Evaluation, improvement and guidance for the use of local-scale emergency prediction and response tools for airborne hazards in built environments

Qualified reference dataset for local-scale hazmat dispersion models

- various emergency response tools
- variables of interest are different from general air quality modeling
- statistically representative dataset

- idealized urban structure (Bastigkeit, 2011)
- aspect ratios typical for Central-European cities (Di Sabatino et al., 2010)
- flat roofs
- building height: **15 m**, **18 m**, **24 m**
- building width: 15 m
- street width: 18 m, 24 m
- scale: 1:225

Vienna

wind tunnel measurements

flow measurements

concentration measurements:

- continuous releases (about 15 – 20 hours full scale)
- puff releases (> 200 releases for each scenario)

Test name		Wind direction	Number of sources used	Number of continuous release measurements	Number of short-term release measurements
A	non-blind	0°	3	104	10
B	blind	180°	4	248	31

Non-blind test: directly available for modellers

Blind test: released only after the results of numerical simulations had been delivered

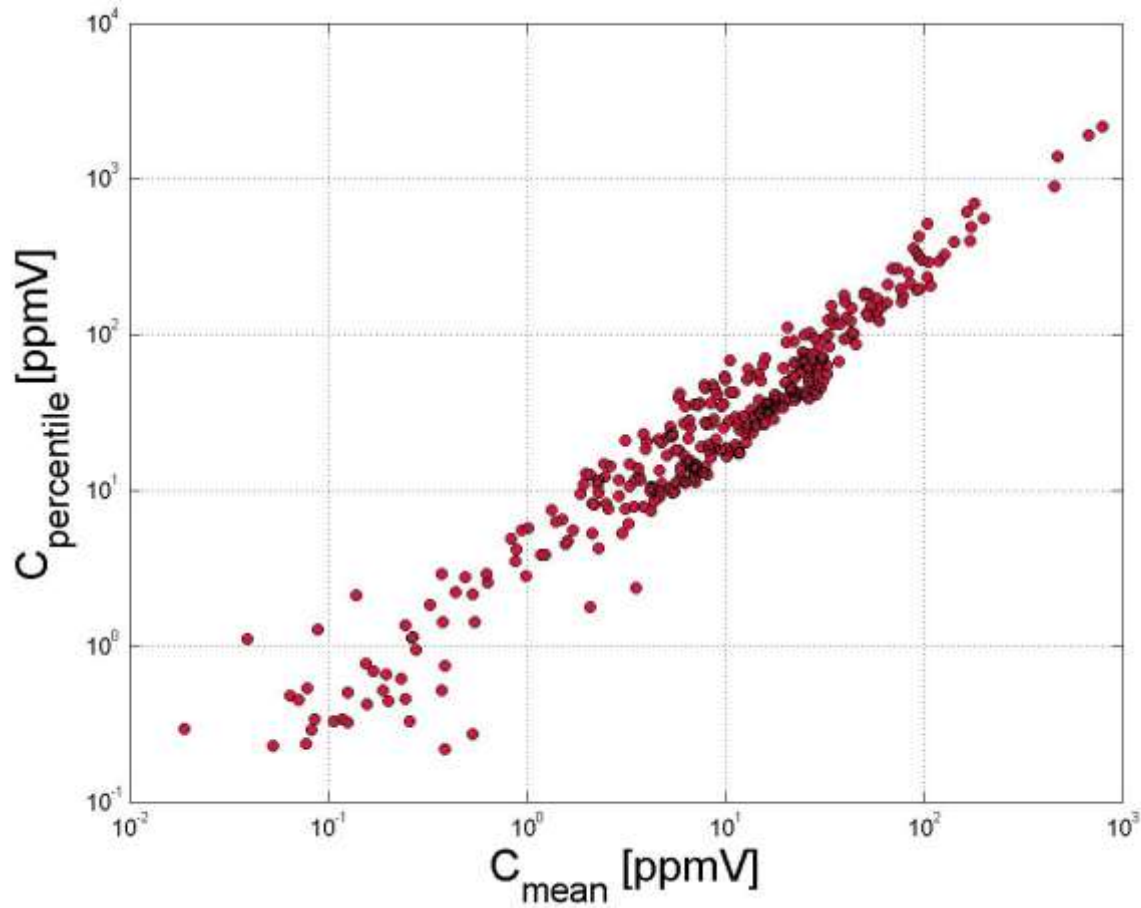

Harms, 2010

- Flow field
 - mean u, v components with uncertainties and RMS (root mean square) values
- Continuous release dispersion
 - mean values and their uncertainty
 - percentiles, peak concentrations for different time averaging
- Puff dispersion
 - distribution of puff parameters, statistics (percentiles, mean, median, mode)
 - peak time and peak concentration for 15 s averaging
- Time series

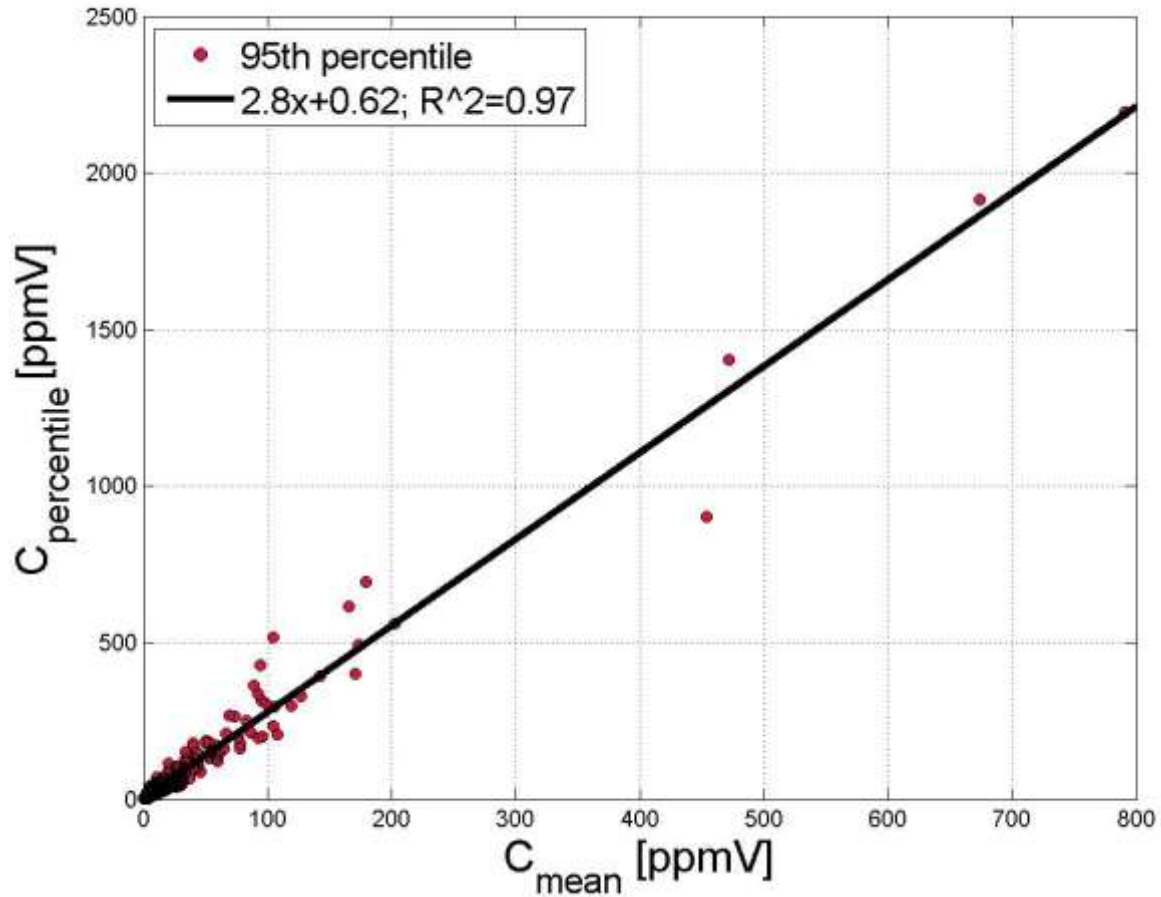

How to predict high concentrations for continuous releases?

- Numerical models predict only mean concentration
 - Gaussian
 - Lagrangian
 - RANS
 - only LES produces a distribution
- Efthimiou et al., 2014
 - mean and standard deviation from CFD results
 - gamma distribution

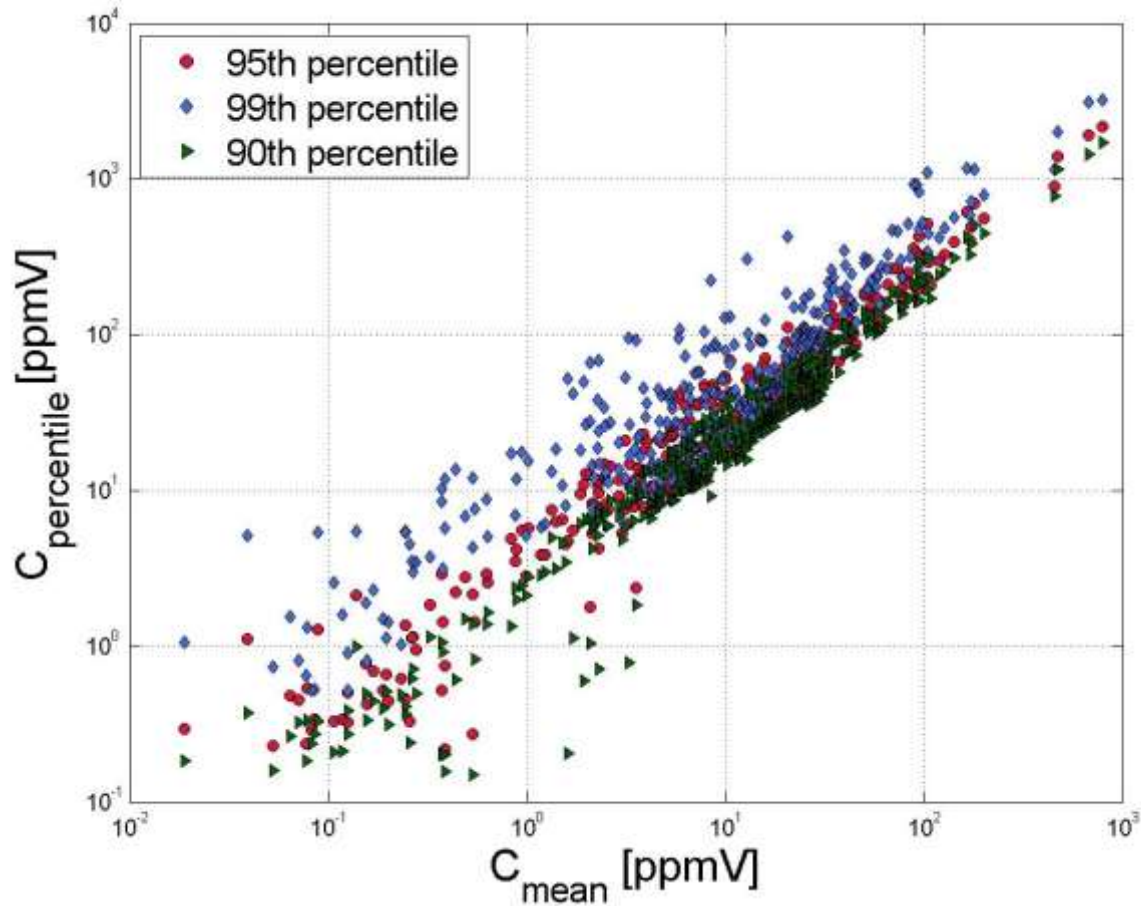

How to predict high concentrations?

How to predict high concentrations?

How to predict high concentrations?

How to predict high concentrations?

- Validation dataset
 - statistically representative dataset
 - flow measurements
 - continuous and puff releases
 - characteristics of transient phenomena: high concentrations, characteristic times
- Prediction of high concentrations
 - gamma distribution fitted on the mean and variance
 - test for other datasets
 - test other probability density functions
