

Experiences using the Delta Tool for model quality assurance

Helge R. Olesen and Matthias Ketzel

A broad perspective

- › The classic single stack problem.
- › The "EU Directive problem" where the Delta Tool comes in.

Classic single stack problem

- › You have a single source surrounded by arcs of monitors.
- › How do you evaluate model performance?
- › “Model Validation Kit”
- › ASTM standard guide D6589 on statistical evaluation of dispersion models

John Irwin

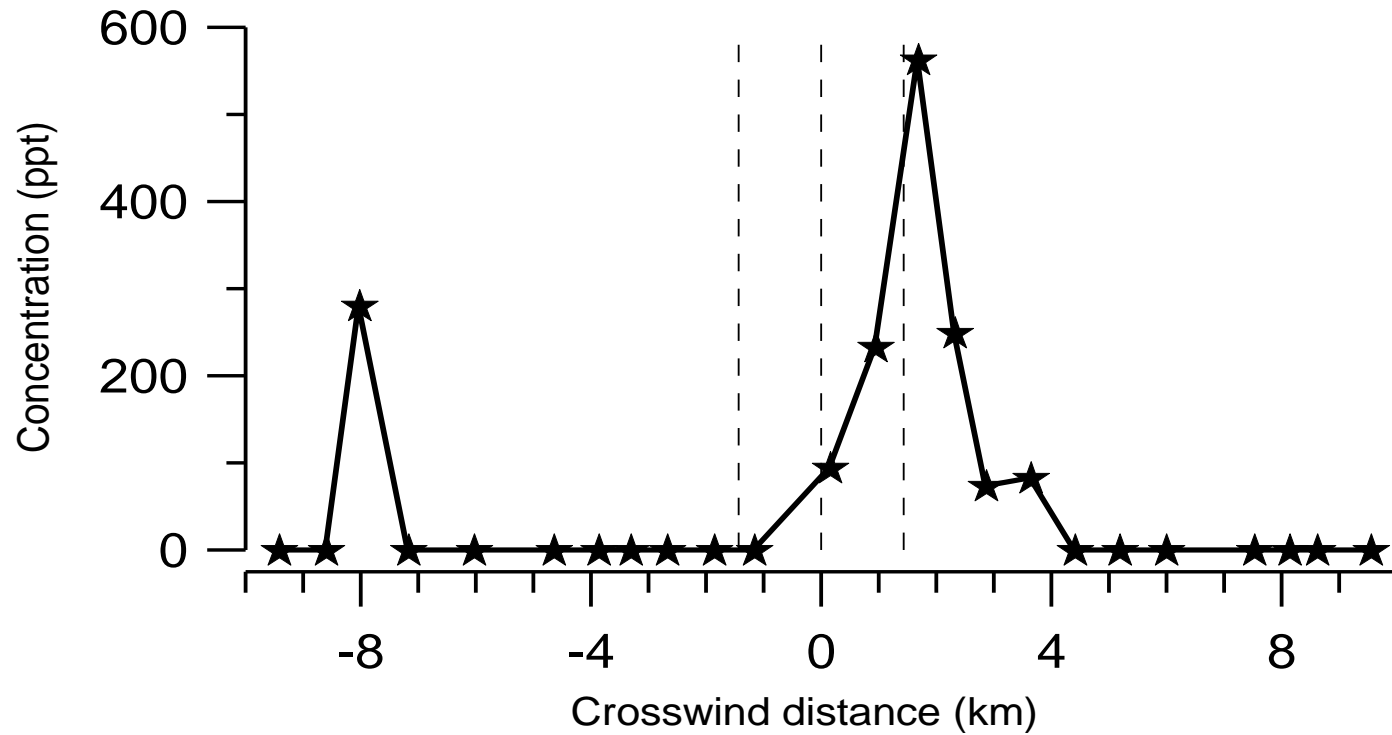

Video...

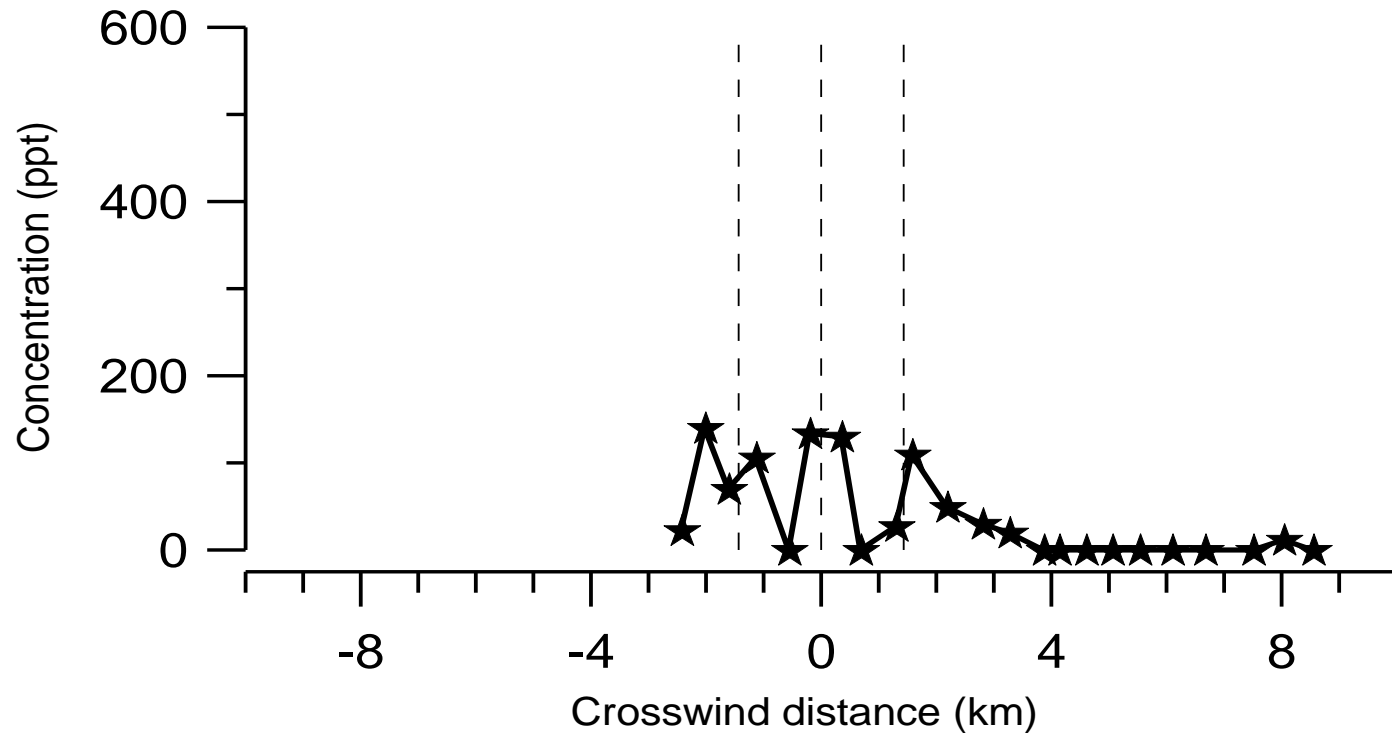

Inherent uncertainty

- › The atmosphere is turbulent with stochastic variations
- › Nature provides us with individual realisations.
- › With our models we can only hope to predict ensemble averages.

Classic stack problem

Conclusion already established in the eighties:

- Pairing model results and observations with respect to time and space is not useful when dealing with a single stack.
It yields a correlation close to zero.

Parameters we may consider

- › Arc-wise maxima (Model Validation Kit)
- › Near centerline concentrations (ASTM Standard Guide)
- › Crosswind integrated concentrations (C_y) and sigma's (S_y) (John Irwin's most recent recommendations)

John Irwins latest recommendations

- › Compare group geometric mean values of observed C_y and S_y values.
John states: "We place too much emphasis on the importance of C_{max} in our model evaluations; C_{max} is dependent upon C_y and S_y (not the other way around)."
- › More on John's work at his website
www.jsirwin.com
- › (you may also go through the URL mentioned in my abstract)

The "EU Directive problem"

- › Models are used to assess compliance with limit values at numerous locations in Europe.
- › How should requirements for model performance be defined? In other words: What "Model Quality Objectives" will it make sense to put into a legal framework?
- › The Delta Tool is work in progress to address this problem. JRC Ispra leads the work.
- › Philippe Thunis has a presentation tomorrow on the Delta Tool.

Differences between the two problems

- › **The classic single stack problem:** We try to model a highly fluctuating signal.
If we compare observations and model results in space and time correlation will be close to zero.
- › **The "EU Directive problem":** For the majority of monitoring sites multiple sources interact.
Background pollution is important.
For the majority of sites we deal with a relatively smooth signal.

Further differences between problems

- › **The classic single stack problem:** The emission source strength is known.
- › **The "EU Directive problem":** The emission inventory is part of the problem. The quality of the *total system* is an issue: *emission modelling plus atmospheric transport and chemistry modelling.*

FAIRMODE Meeting – draft agenda first day

Wednesday, 10th of April 2013

Elzenveld Conference Center in Antwerp, Belgium

| | | |
|--------------|--|--|
| 09:00-09:45 | Registration and welcome coffee | |
| 09:45-10:15 | Welcome by the host | Elke Trimpeneers (IRCELINE) & Stijn Janssen (VITO) |
| 10:15-10:45 | The Air Policy Review process – status quo and future developments | DG Environment (tbc) |
| 10:15-11:00 | FAIRMODE – where we are within working group 2 | Stefano Galmarini (JRC) |
| 11:00 -11:20 | Coffee Break | |
| 11:20-12.30 | WG2 – Quality assurance and benchmarking | Stefano Galmarini (JRC) |

SG4: Benchmarking and Model Quality Objectives

- ***Experiences/comments from participants regarding Model quality objectives and discussion***
- ***Discussion***
- ***DELTA tool: Overview of updates***
- ***DELTA tool: MIS experiences & feedback***

The Delta Tool

- › A set of software. The user prepares
 1. Data for one year of observations for a number of stations.
 2. Model results at the corresponding locations.
- › The system provides a common frame of reference for evaluating model performance.
- › It is possible to make some exploratory analyses within the system.
However, the core is a Benchmarking report

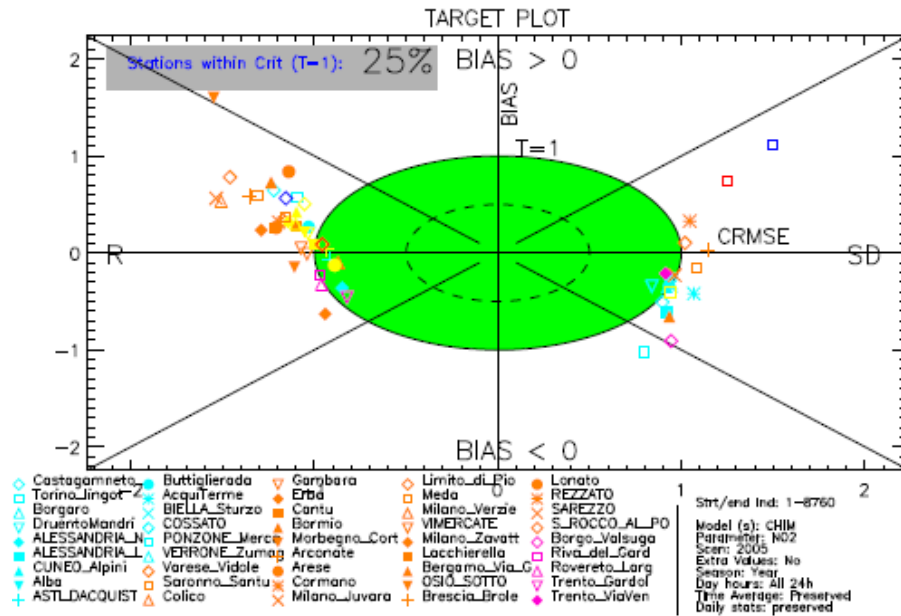

Notes on the Benchmarking tool

- › It is in a testing fase.
- › The tool operates with performance criteria, but these are provisional and subject to discussion within the Fairmode community.
- › There have been several versions of the tool with some major changes.
- › For normalisation the plots now use **measurement uncertainty** (Delta Tool version 3.x).

Some remarks on the Delta Tool

- › Keep in mind: What do the underlying data represent?
- › Establishing a common frame of reference is a good thing. It allows us to make a proper comparison of comparable results.
- › However, care should be taken, especially when it comes to policy aspects.
- › The data underlying two different benchmarking reports may represent two different challenges.

Remarks - continued

- › As an extreme, imagine the classic single stack problem put into the Delta Tool framework.
- › Poor performance in respect to the target plot is not necessarily an indicator of *unacceptable* model performance – it depends on the challenge you pose to a model. Further, you should consider fitness for purpose.

Examples where high correlation is hard to achieve

- › A site under influence from a major point source is difficult to model correctly.
- › A traffic site where traffic data are inaccurate, possibly just slightly shifted in time.

Delta Tool: Practical aspects

- › Not everything runs smoothly when you are a first time user. However, feedback to the developers can improve this.
- › A number of minor issues were brought up at the Fairmode plenary in April, regarding such things as better explanations of graphics.
- › There is so far not a set of explanatory notes, which could ease interpretation of the Benchmarking reports.

Conclusion

- › Those of you working with modelling in the context of the European Air Quality Directive should sooner or later acquaint yourself with the Delta Tool.
- › Report any issues you may find to the developers.
- › We should step carefully as to how the Delta Tool eventually should be used in conjunction with the Air Quality Directive. We should not impose unreasonable requirements on ourselves.
