

# RIO: a novel approach for air pollution mapping

**Stijn Janssen<sup>1</sup>, Nele Veldeman<sup>1</sup>, Clemens Mensink<sup>1</sup>,  
Gerwin Dumont<sup>2</sup> and Frans Fierens<sup>2</sup>**

(1) VITO, Belgium

(2) IRCEL, Belgium

**HARMO 12  
Cavtat - Croatia, 6 – 9 October, 2008**

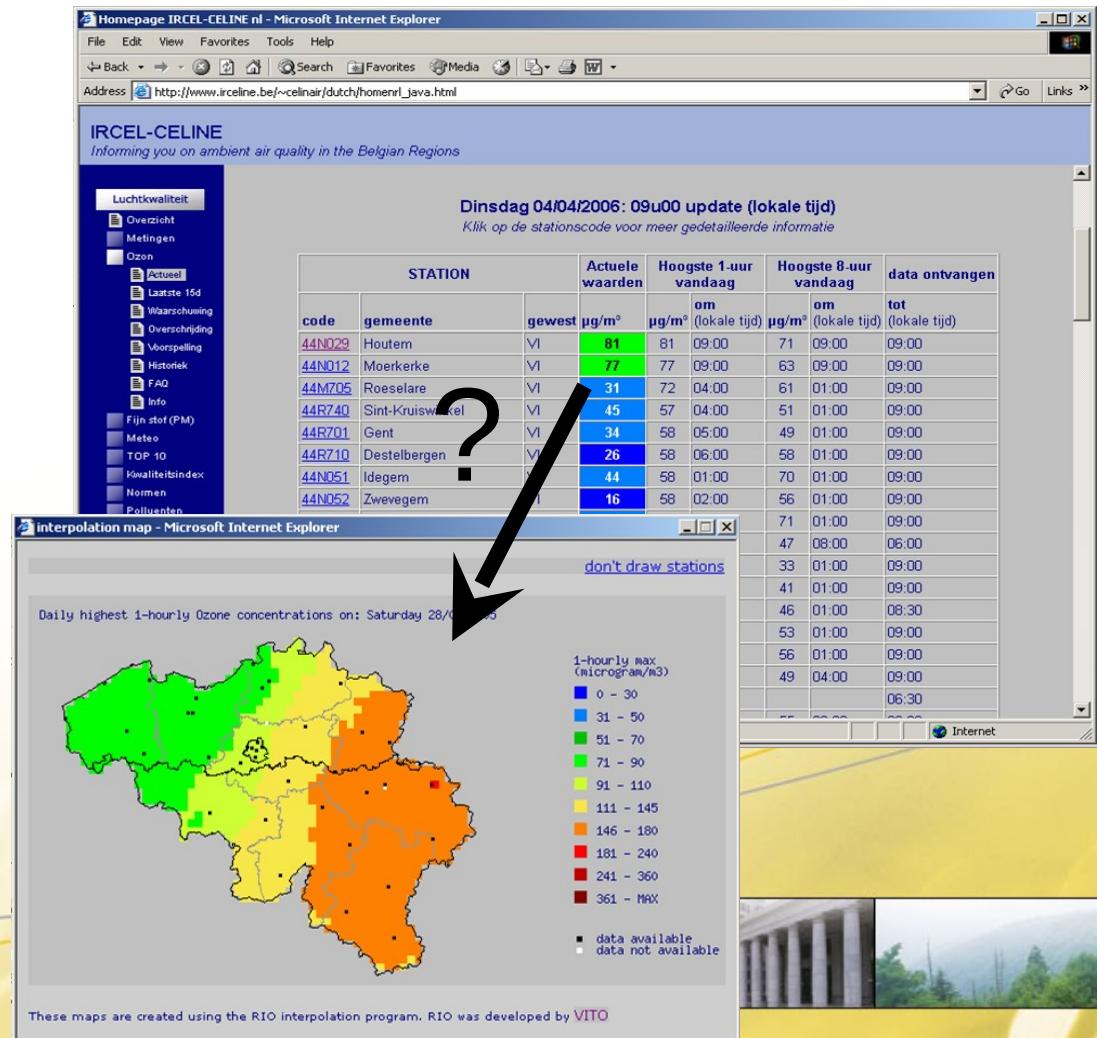

# Introduction

- Belgium is a rather small country with highly **urbanized regions**
- Air pollution is a **serious problem** in some regions
- **EU air quality standards** are not met everywhere

# Introduction

- Air quality is sampled by a **dense network** of monitoring sites
  - e.g. about 60 to 70 stations for NO<sub>2</sub> and PM<sub>10</sub> in Belgium
- Real-time measurements are **published one-line** by IRCEL
- Need for **reliable maps** to inform the public in near real-time
- How to **create** an air quality map from point values?
  - Use a model

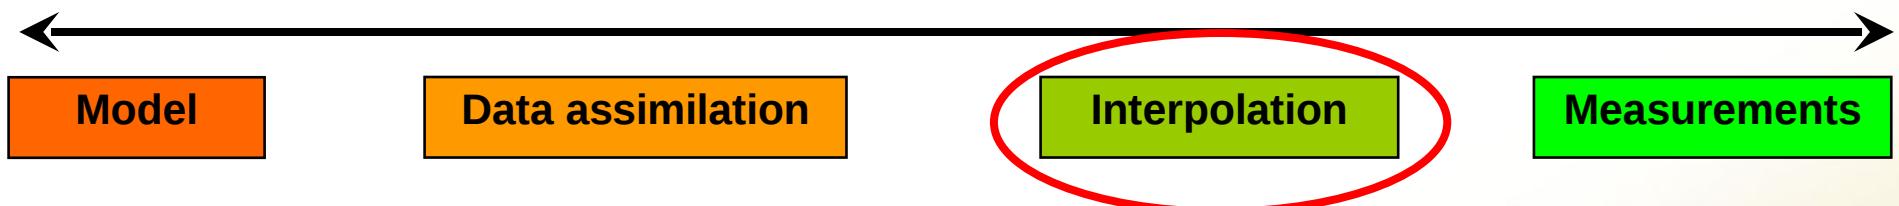

# Introduction

- According to EU Directives:
  - Air quality assessment for entire **air quality zones**
  - Indicator for **human exposure**
- Need for **reliable maps** with annual averages and statistics

# Introduction

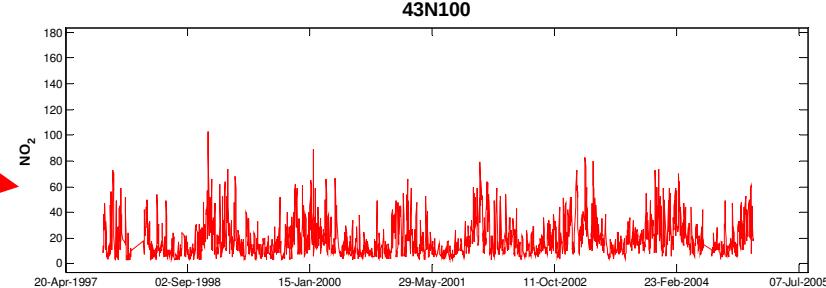

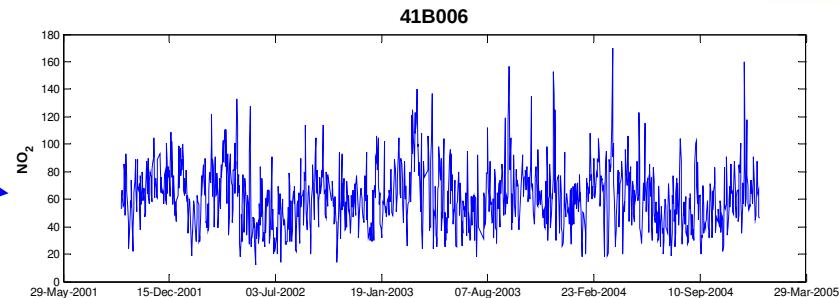

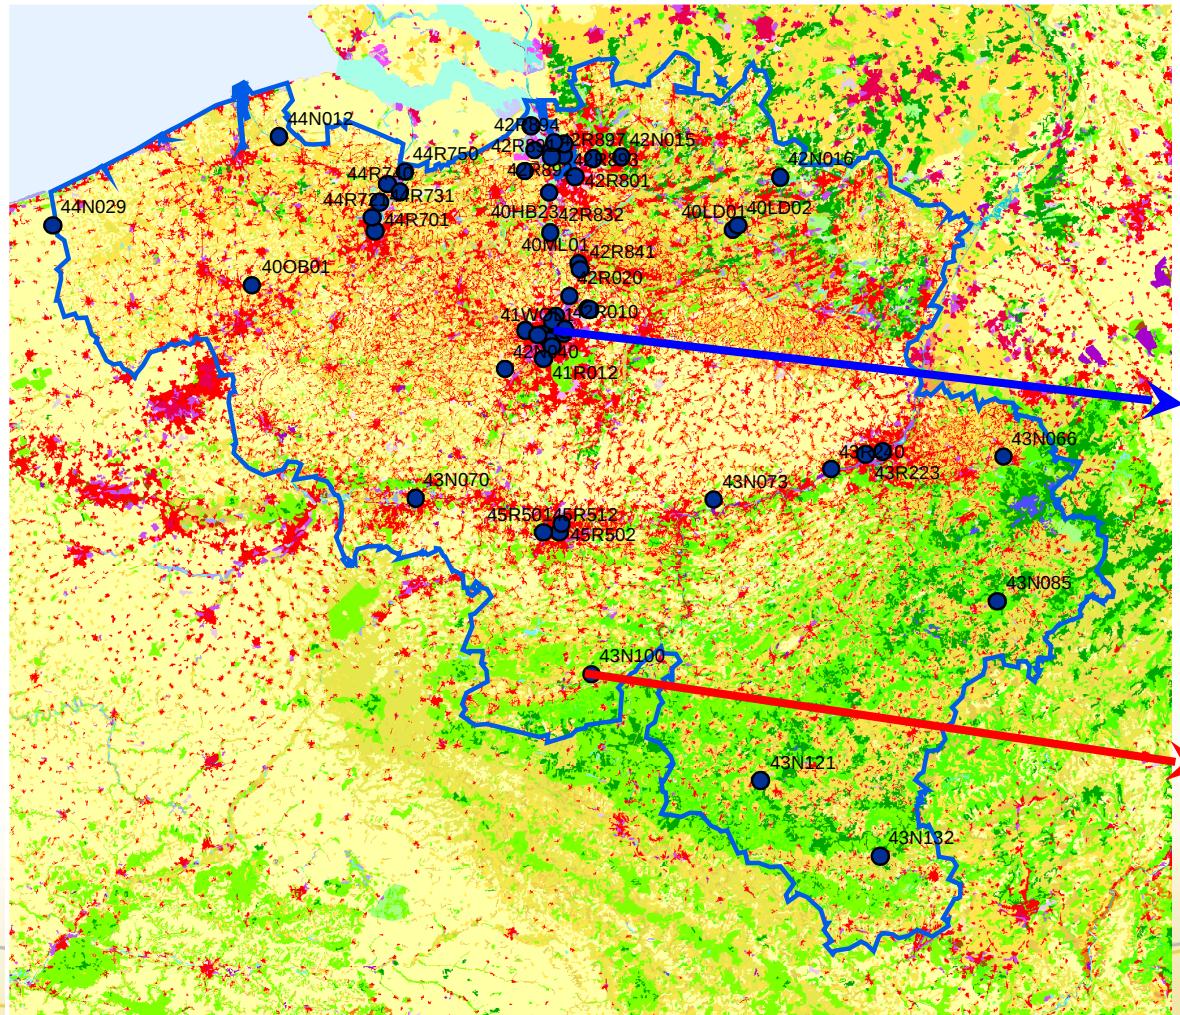

- A wide variety of tools is available for an Environment Agency to accomplish these tasks

- Interpolation tools are only applicable for a **limited set of tasks** (assessments, mapping,...)
- Advantages of an (intelligent) **interpolation model**:
  - Fast (near real-time)
  - Accurate
  - Simple

# Introduction

# RIO-model: Methodology

- Observation:
  - Sampling values **depend on land use** in (direct) vicinity of the monitoring site
- Consequence:
  - Interpolation scheme needs to **know this relation** between land use and air quality levels
- Approach in RIO-model:
  - Create **land use indicator** to express this relation

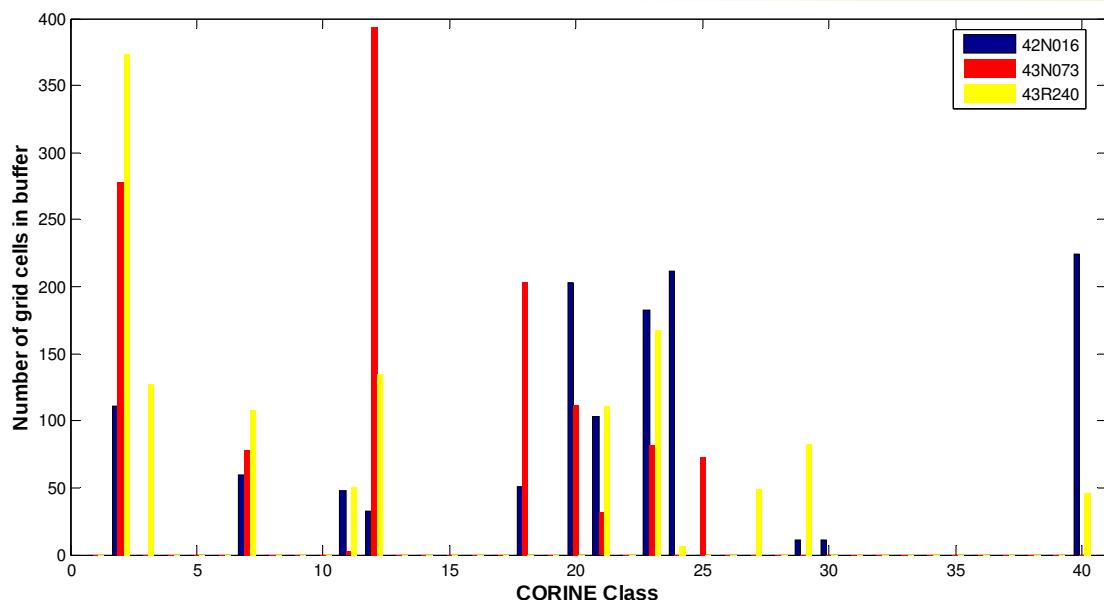

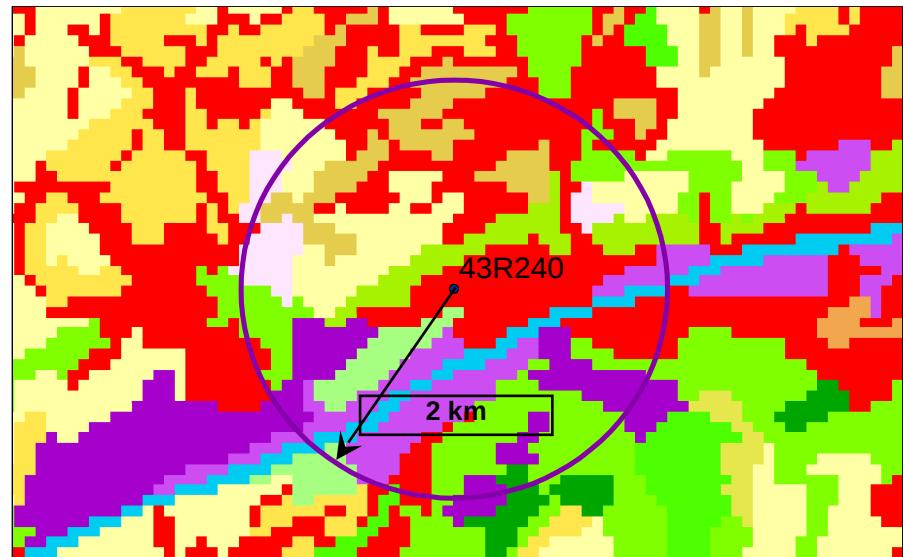

# RIO-model: Land use indicator

## Land use indicator

For each station:

- Determine buffer  
(e.g. 2km radius)
- Characterize land  
use by CORINE  
class distribution  
inside buffer

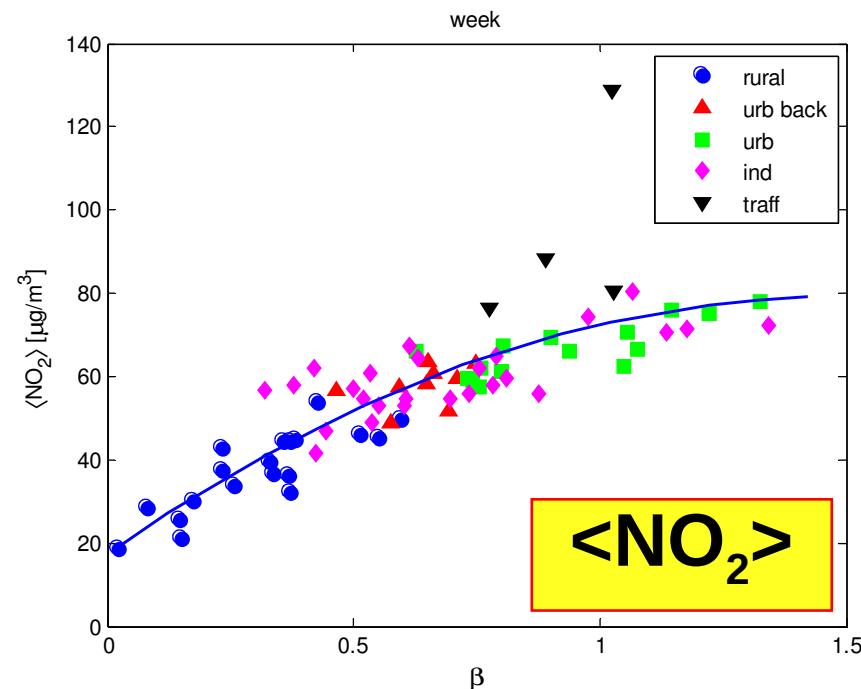

# RIO-model: Land use indicator

## RIO-model

- Land use indicator is based on CORINE class distribution

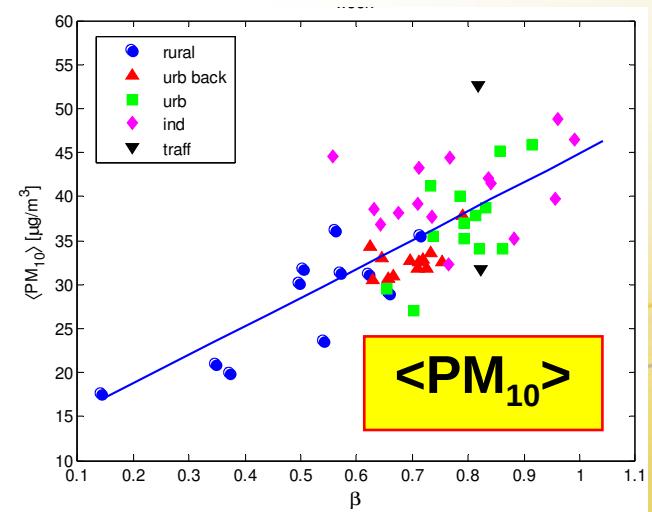

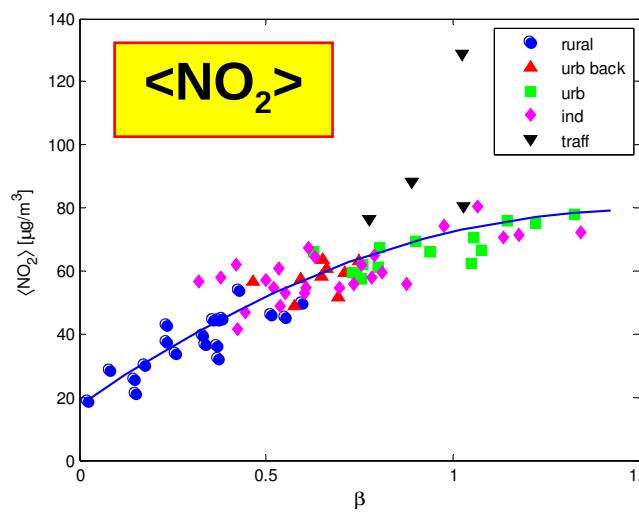

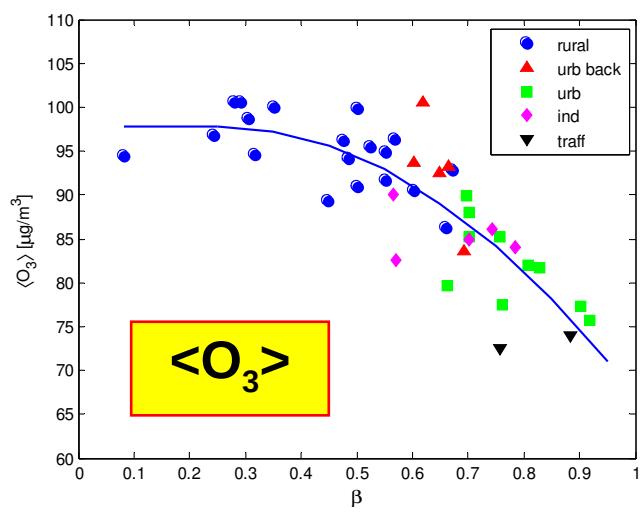

$$\beta_{\text{CORINE}} = \log \left( \frac{1 + \sum_i (a_i \cdot n_{\text{CORINE class } i})}{\sum_i n_{\text{CORINE class } i}} \right)$$

- Calibration of coefficients  $a_i$ :  
multi-regression to optimize trend for mean and standard dev. of monitoring data

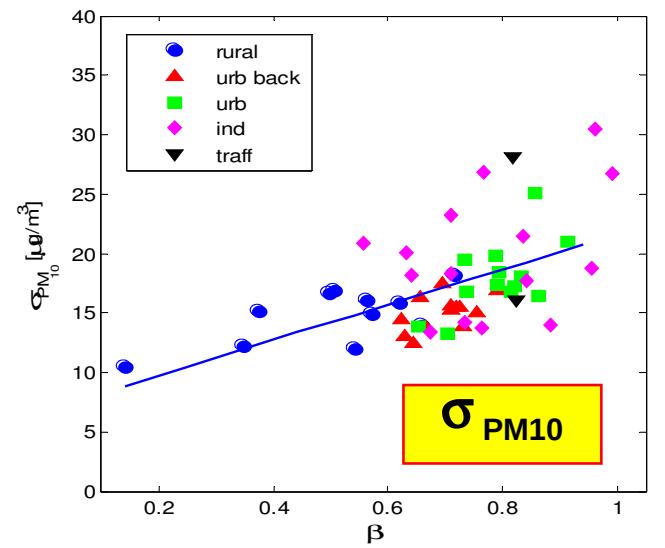

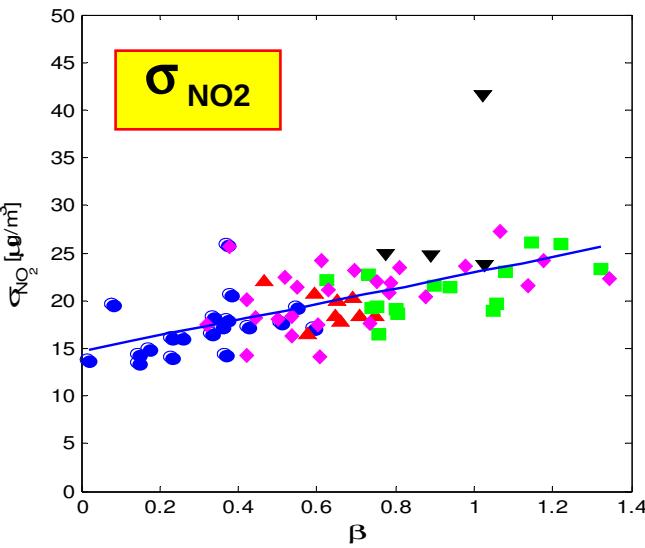

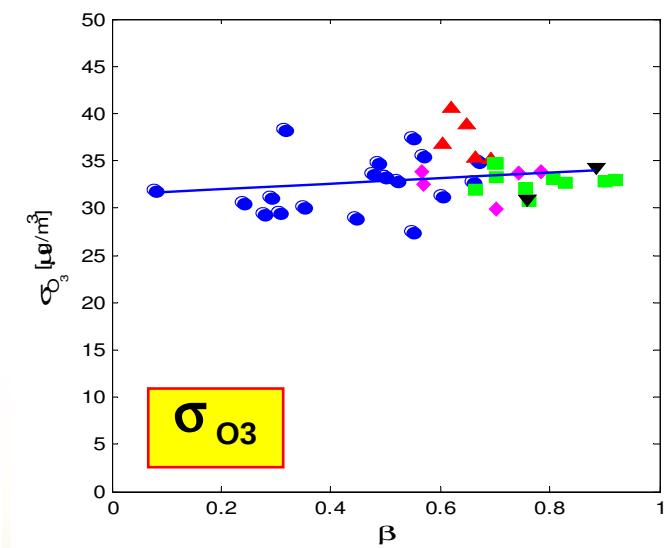

# RIO-model: Trend functions

- Trends in long tem **mean** of sampling values:
  - Relation between land use and average air quality levels
  - Smooth transition** between rural and urban sites

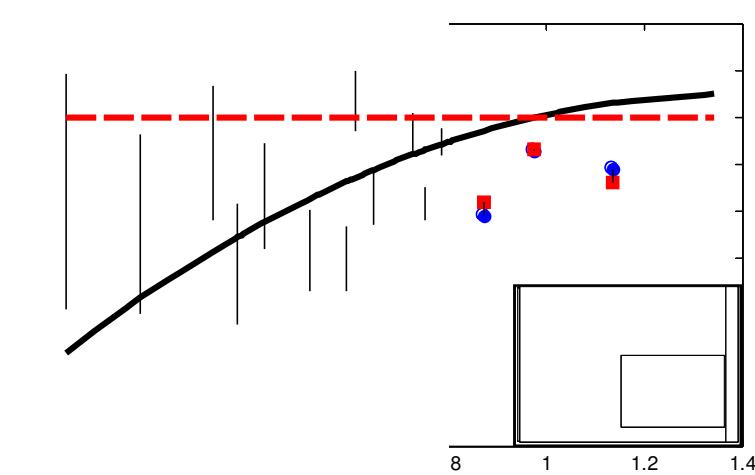

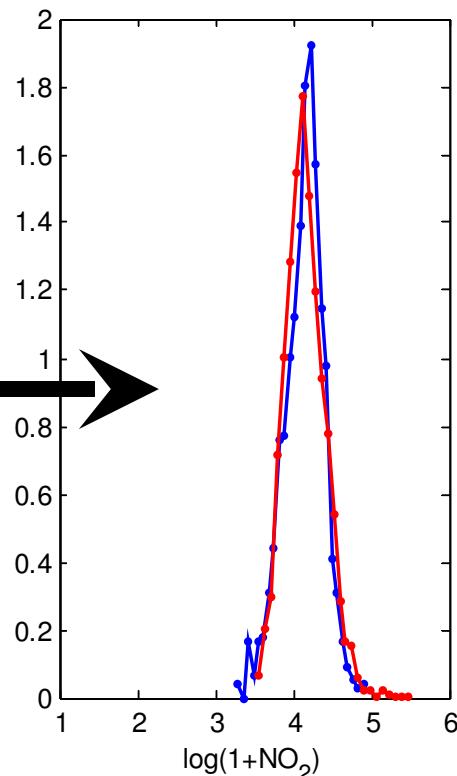

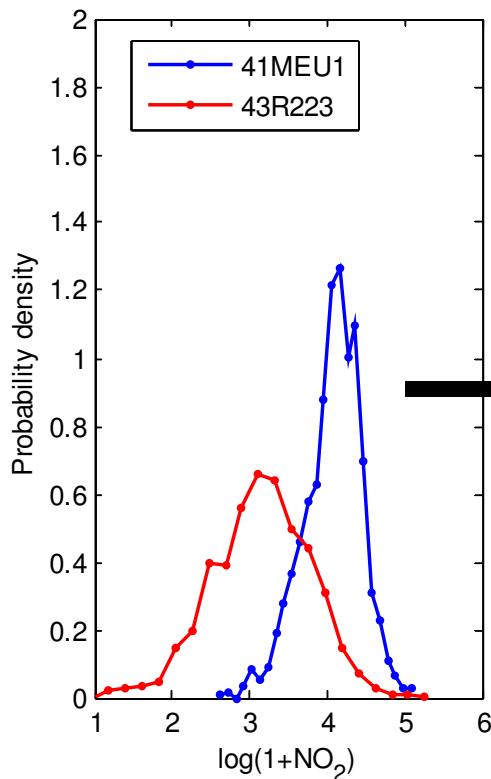

# RIO-model: Trend functions

- Trends also observed in **standard deviation** of sampling values:

# RIO-model: Detrending

- Use relation between land use indicator and AQ statistics to “**detrend**” monitoring data:
  - Remove **local character** of sampling values

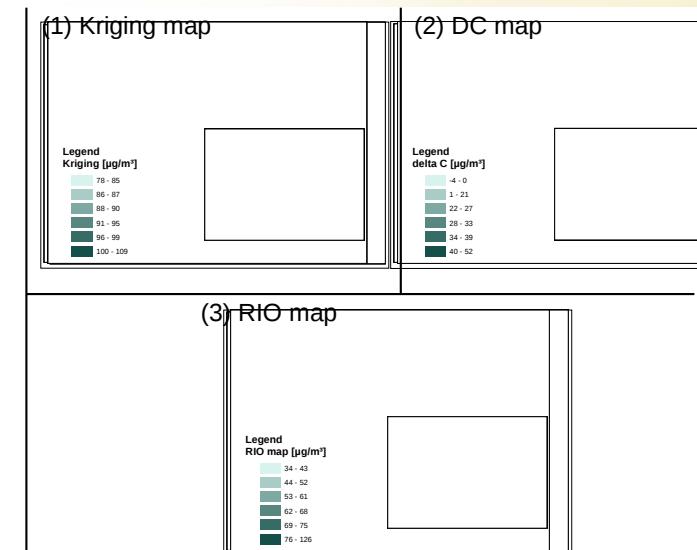

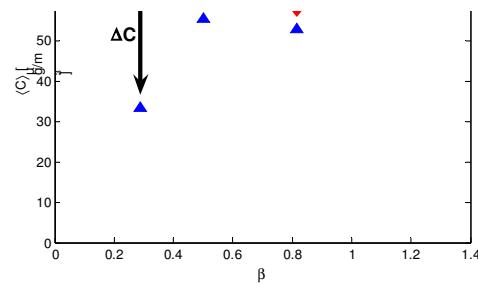

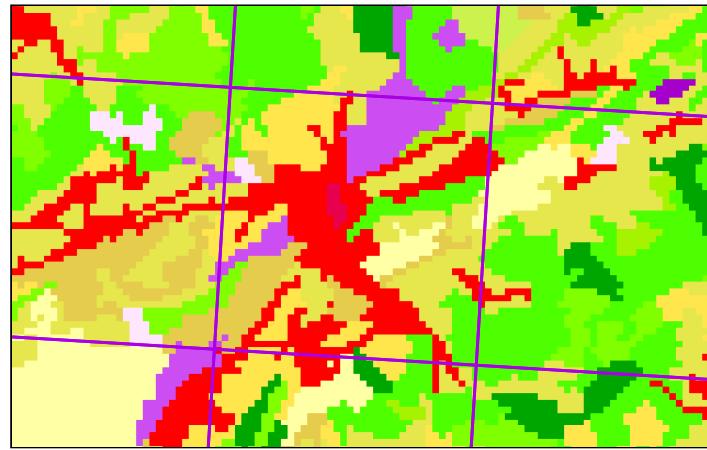

ed

# RIO-model: Methodology

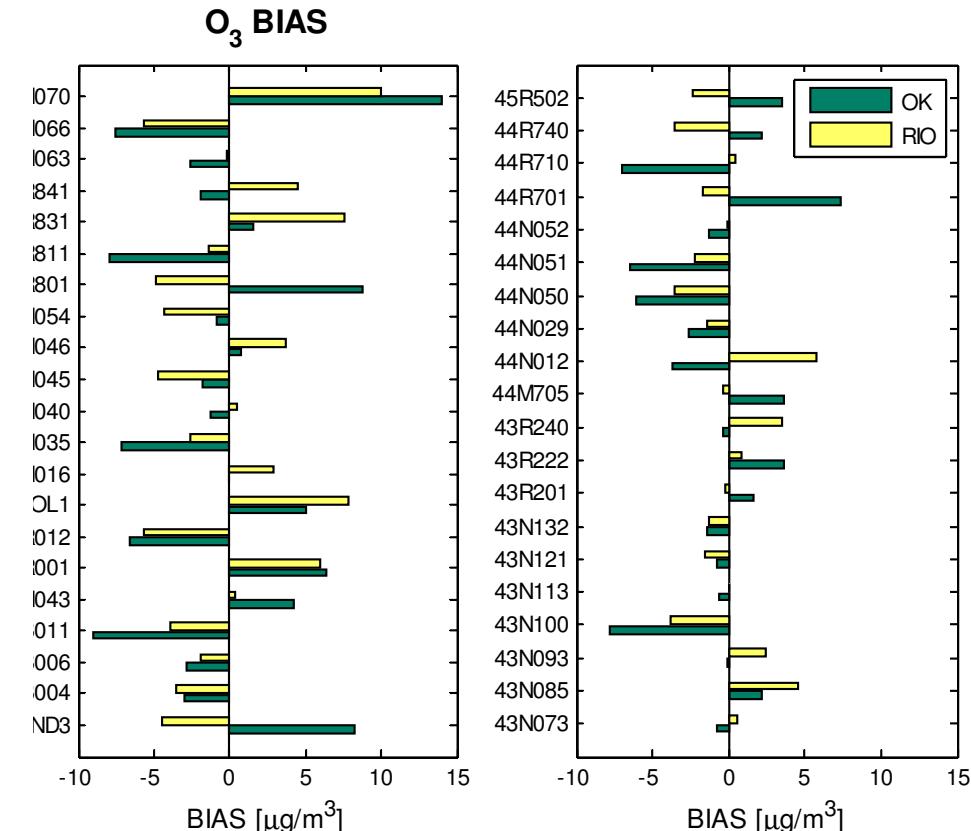

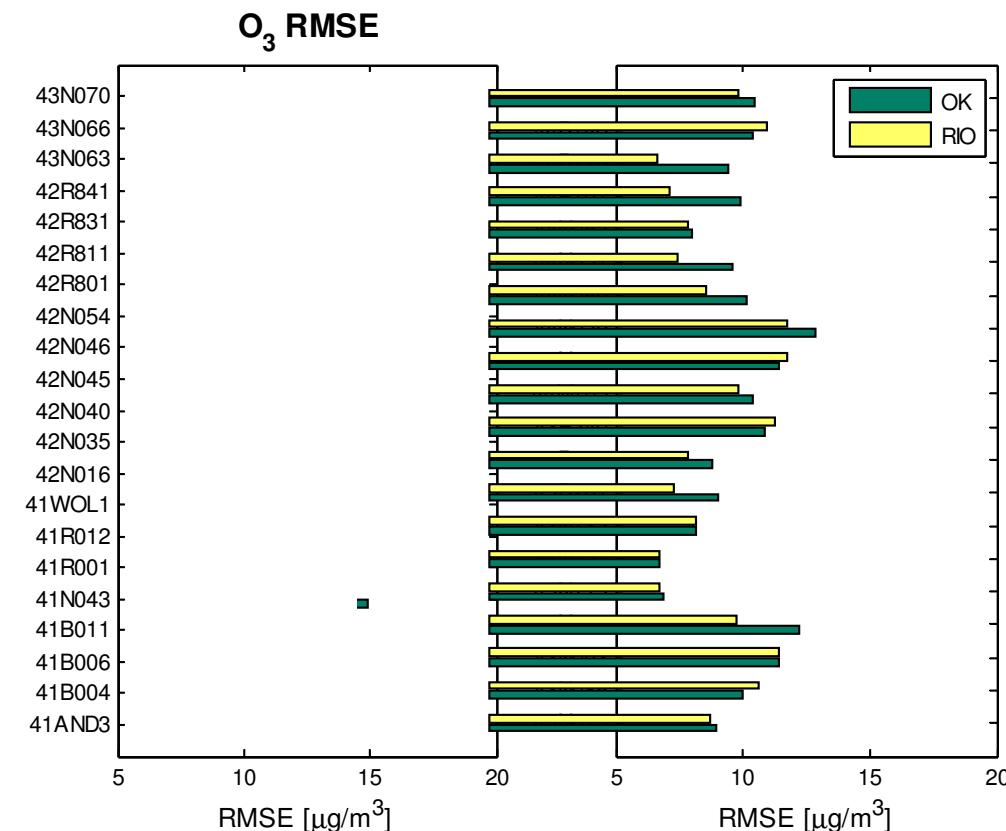

## RIO methodology:

- Detrend sampling values
- Interpolate detrended values with Ordinary Kriging
- Determine local  $\beta$ -value
- Get corresponding trend shift ( $\Delta C$ )
- Add  $\Delta C$  to interpolation result

# RIO-model: Validation

Validation: leaving-one-out. Compare with standard OK

# RIO-model: Validation

Validation: leaving-one-out. Compare with standard IDW and OK

Model	$O_3$		$NO_2$		$PM_{10}$	
	RMSE	Bias	RMSE	Bias	RMSE	Bias
IDW	10.97	-1.70	18.17	4.74	12.12	1.70
OK	10.37	-0.44	16.85	1.45	11.65	1.22
RIO	9.56	-0.08	14.45	-0.67	9.89	0.01

# RIO: Near real-time application

# RIO: Annual averages

Annual average NO<sub>2</sub> concentrations for 2006

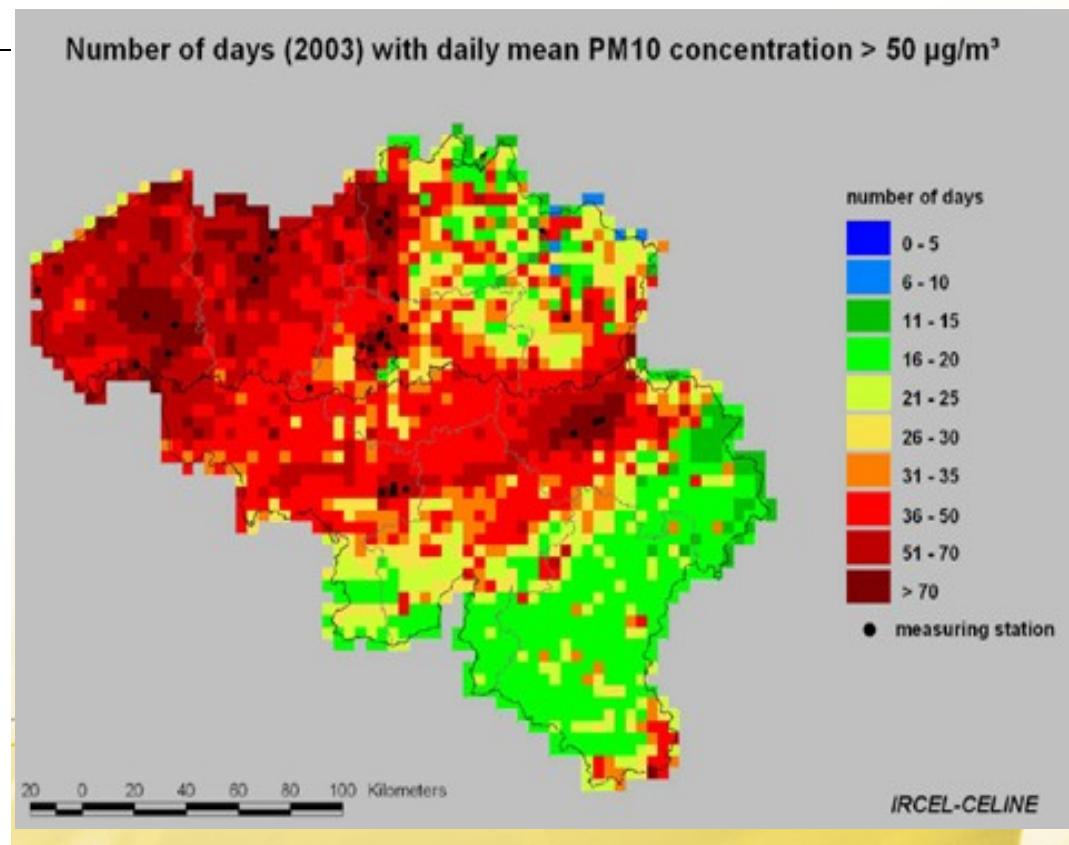

# RIO: Annual averages

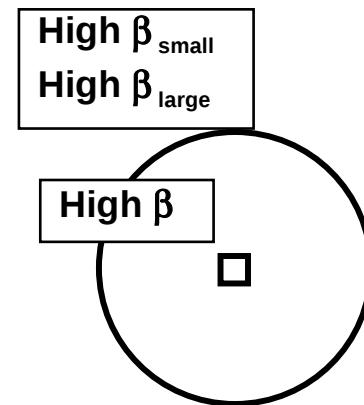

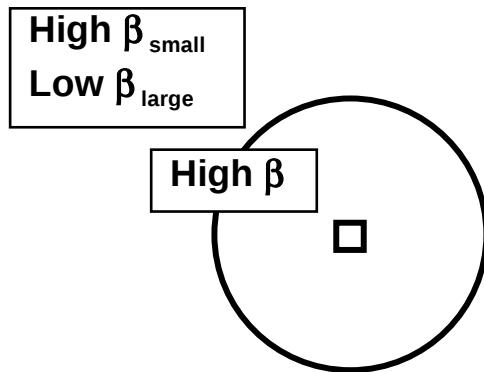

Annual averaged PM<sub>10</sub> concentrations for 2006

Number of days exceeding the 50 µg/m<sup>3</sup> daily PM<sub>10</sub> limit in 2003

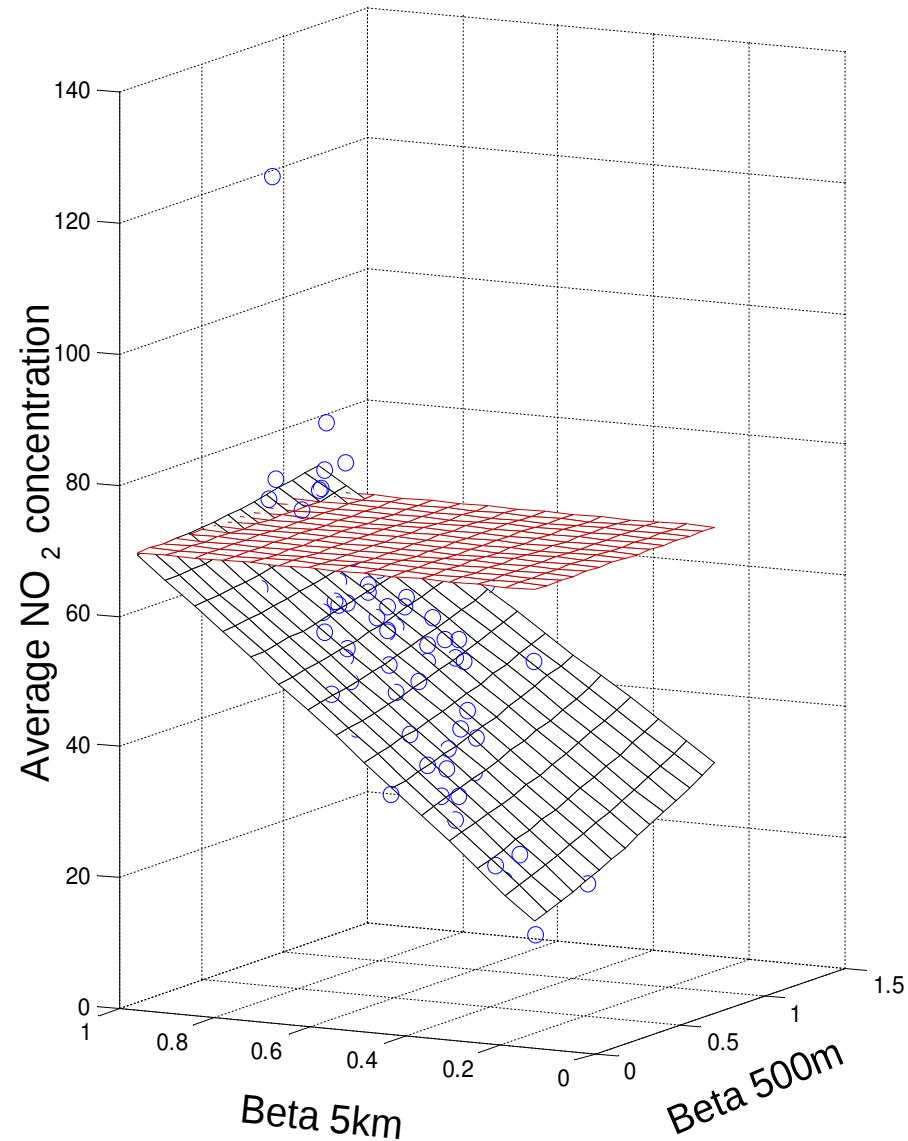

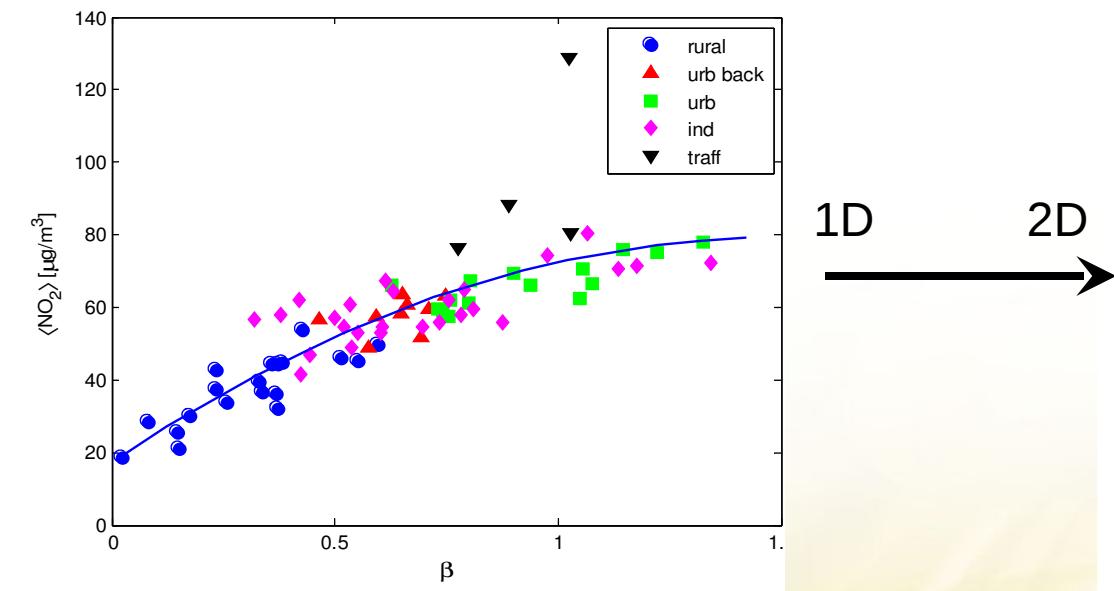

# RIO: New developments

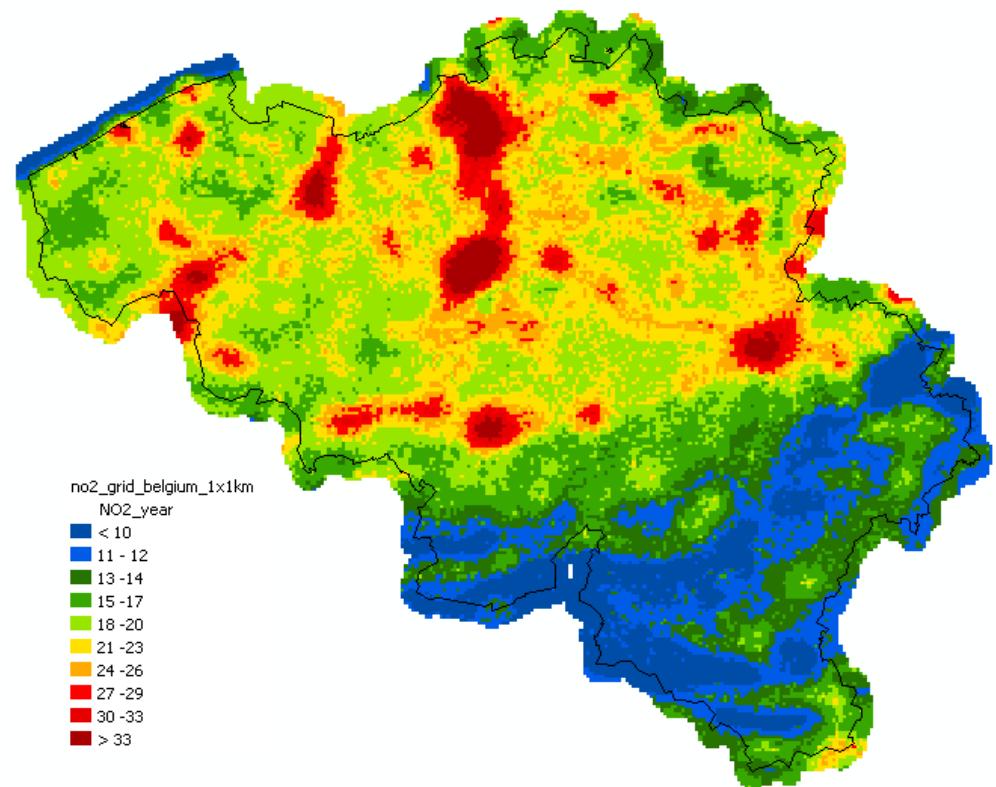

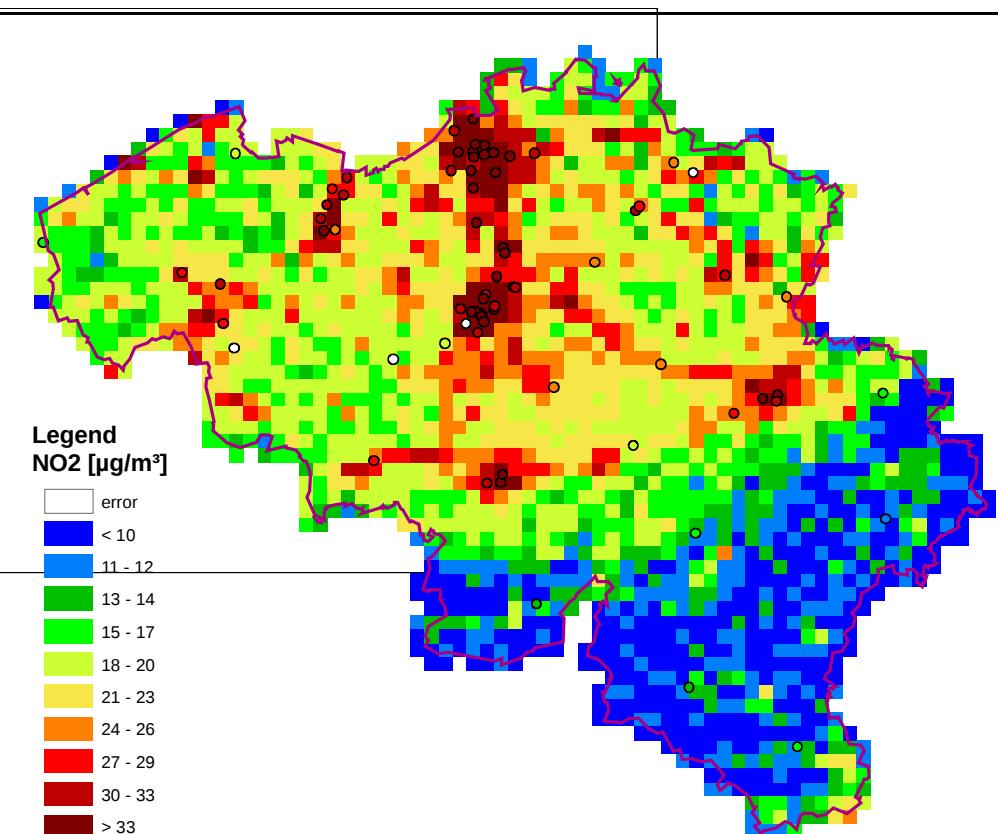

# RIO: New developments

- Double scale in  $\beta$  parameter
  - Combined land use information at 1km and 10km spatial scale

# RIO: New developments

# Conclusion

- RIO is an operational **interpolation scheme** for ambient air pollution ( $O_3$ ,  $NO_2$ ,  $PM_{10}$ , ...)
- **Kriging** is used as interpolation tool
- A land use model is applied to incorporate **local patterns**
- Detrending is an **essential step** for the interpolation of air quality values
- Intelligent interpolation models can be applied as **accurate, efficient and fast** assessment tools
